PLANNING DISTRICTS

Highlights

- o Planning districts located closest to downtown Boston, with a high proportion of young adults, gained population, while other areas of the City lost population between 1970 and 1980 for a net decline of (562,994) for Boston.
- o With a stable number of households and persons in group quarters, the 13 percent loss in persons per household (to 2.4) in 1980 accounted for the overall population loss. Household size shrank in almost all neighborhoods.
- o Boston's shifts in age distribution and in household composition paralleled nationwide trends toward increasing numbers of young adults and smaller, increasingly nonfamily households.
- o Although females continued to outnumber males, the ratio of males to females increased during the 1970s largely due to the influx of males into predominantly young-adult neighborhoods.

Age Composition

- o Boston's population was younger and had "aged less slowly" than that of the Boston metropolitan area and the United States as a whole. Boston's lower 1980 median age of 28.9 years was influenced by significant numbers of students, young adults and minority families balanced by areas of older, largely white residents.
- o In 1980, the age composition of Boston's population centered on the 20-34 year-old age groups which contained one-in-three persons compared to one-in-four persons in 1970. All other age groups, whether older or younger, shrank as a proportion of the total except the 15-19 year and 75 and older age groups. The largest shrinkage, 37 percent, occurred in the 0-14 age group because of declines in births and net outmigration of children.
- o In general, most neighborhoods followed the same citywide 1970-80 pattern of gains for those 20-34 years and those 75 years and over, and of loss among those under 20 and those aged 35-74. However, there were notable divergences in these trends for some neighborhoods and in their initial (1970) and final (1980) age distributions.

Race and Ethnic Composition

- o During the 1970-1980 decade, the proportion of whites declined from 82 to 70 percent of Boston's population while that of blacks increased to 22 percent, Asians to 3 percent and other races to 5 percent of the total. Growth in "other races" reflected selection by hispanics in 1980 of that category rather than the white or black categories, especially in Jamaica Plain and North Dorchester. While all neighborhoods had a lower proportion of whites in 1980 than in 1970, the ordering of neighborhoods with regard to proportion of whites and nonwhites was relatively stable. A notable exception was Hyde Park, with a growth in the proportion of blacks. Large increases in blacks occurred in

Mattapan. The Asian population of Central and Allston-Brighton also increased rapidly.

- o The self-reported hispanic population of Boston doubled to some 36,000 during the 1970-1980 decade, with all neighborhoods except South Boston showing some increase. The largest enclaves of hispanics were located in Roxbury and Jamaica Plain in both censuses.
- o Four percent of Boston's population spoke English either not well or not at all. Of these, a high proportion spoke Asian languages or Spanish.

Household Composition

- o During the 1970s, the composition of households in Boston changed substantially. Family households declined from 65 to 53 percent of households, an 18 percent drop in numbers. Nonfamily households (individuals living alone or with other unrelated individuals) increased complementarily from 35 to 47 percent of Boston households, an increase of one-third, to over 102,000 households out of the over 218,000 total.
- o Within the family category, married couples with and without children declined by 28 percent to one-third of Boston's households. Married couples with children declined by 35 percent to 34,000 households (15 percent of the total). Other family households, those lacking a married couple, comprised 20 percent of Boston households in 1980. Within this group, female-headed households with children under 18 years made up 10 percent of all Boston households and 38 percent of all families with children under 18 in Boston, compared to 23 percent in 1970.
- o In 1980, 37 percent of Boston households contained only one person compared to 29 percent in 1970. Twenty-one percent contained a single female. One-in-ten contained two or more roommates.
- o The mix of family and nonfamily households varied by neighborhood. In Back Bay-Beacon Hill and Fenway-Kenmore where young adults predominated, fewer than 20 percent were families. The proportion of family households was below 40 percent for Central, South End and Allston-Brighton. The proportion was between 50 and 60 percent in Charlestown, South Boston, and Jamaica Plain. Families comprised close to two-thirds or more of the households in the remaining neighborhoods. The proportion of non-family households complemented these numbers.
- o All neighborhoods had a growth in nonfamily households and a decline in family households between 1970 and 1980.
- o The proportion of households occupied by elderly living alone has remained stable at just over 10 percent of the total, while there was a decline of 10,000, or 13 percent, in the number of Boston's elderly residents during the 1970 decade.

Educational Attainment

- o Between 1970 and 1980, the proportion of Boston residents who had completed four years of college or more doubled to 20 percent, while the fraction of those with at least some college education grew from one-in-five to one-in-three. Great disparities in educational attainment existed between the neighborhoods. Back Bay-Beacon Hill residents tended to have the highest educational attainment, while East Boston and Roxbury had the lowest.

Labor Force

- o Civilian labor force participation rose to 60 percent in 1980 because an increase in female participation, from 48 to 53 percent, more than offset the slackening of male participation from 72 to 69 percent. The highest participation rates, about 70 percent, were recorded for Back Bay-Beacon Hill and Central. Also, residents of twelve out of the sixteen neighborhoods had higher participation rates in 1980 than in 1970. Participation rates declined in East Boston, South Boston, Roxbury and Roslindale.
- o Among Boston families, one-in-five had two wage earners, one-in-three had one wage earner, and one-in-two had no wage earner. Two-worker families were prevalent in neighborhoods of higher socio-economic status. The proportion of families without workers was high in areas with large numbers of students, retirees, less educated residents and minorities. These neighborhoods also had low labor force participation rates and higher than average unemployment rates.
- o During the 1970s, a substantial shift occurred among the industrial sectors of employment. The largest gain, some 30 percent, occurred in employment in education, followed by a 20 percent gain in professional, related, and health services. By 1980, 46 percent of Boston's workers were employed in finance, business and professional services industries of all kinds compared to 38 percent in 1970. In most neighborhoods, the proportions employed in the various industries tended to follow the citywide average with some disparities.
- o A shift in the occupational structure of Boston's workforce paralleled the industrial trend. Workers in professional, technical and managerial occupations grew by 30 percent to 78,000, or over 30 percent of the 256,000 total workers in 1980. Changes in the occupational distribution in the neighborhoods have paralleled those of Boston with some being more dramatic and some more gradual.
- o In 1979, 58 percent of Boston residents were employed full time, year round. The larger-than-expected residual was attributable to areas with students and minorities, especially hispanics, where part-time employment and unemployment rates tended to be higher.

Location of Work

- o Three-fourths of Boston resident workers were employed in the City while one-fourth worked outside. These proportions varied among the neighborhoods ranging from over 80 percent of South Boston and Roxbury workers to only two-thirds of West Roxbury and Hyde Park workers employed in Boston.

Income

- o Household, family and unrelated individual income increased substantially during the 1970-1980 decade to \$12,530, \$16,062 and \$5,877, respectively. However, the increases in all three measures lagged behind the increases shown for the Boston metropolitan area and did not match the rate of inflation.
- o The planning districts with the highest median household incomes in 1980 were, in order, West Roxbury, Hyde Park, Back Bay-Beacon Hill, Roslindale and Central. While these neighborhoods have sizable proportions in the income ranges under \$5,000 and \$10,000-\$19,999, they were distinguished by a substantial proportion in the \$20,000-\$39,999 range within the suburbanlike neighborhoods, or by a relatively high proportion in the category earning \$50,000 or more in Central and Back Bay-Beacon Hill.
- o Fenway-Kenmore and Roxbury had the lowest median household incomes in 1980. Fenway-Kenmore had the lowest median unrelated individual income while Roxbury had the lowest median family income.
- o The neighborhoods with the highest proportions of families in poverty were Roxbury (30 percent), North Dorchester (24 percent), and Jamaica Plain (22 percent). High proportions in poverty were related to both low family income and high proportions of female-headed families with children.
- o The highest proportions of unrelated individuals in poverty were found in Fenway-Kenmore (41 percent) and Allston-Brighton (32 percent), reflective of large student populations living in and outside of dormitories.

Housing

- o Increases in the number of housing units and households occurred in South End, Allston-Brighton, Central, Back Bay-Beacon Hill, West Roxbury, and Charlestown. Large losses of each occurred in Mattapan, Roxbury, North Dorchester, and South Dorchester.
- o In both 1970 and 1980, 27 percent of Boston's households were owner-occupied while 73 percent were renter-occupied. The highest proportions of renter households continued to be in Fenway-Kenmore, Central, South End, Allston-Brighton and Back Bay-Beacon Hill. Those with the lowest proportions of renters continued to be West Roxbury, Hyde Park, and Roslindale with their high proportion of single-family homes.

- o In 1980, Boston's mean household size was 2.40 persons, down from 2.76 persons per unit in 1970. Declines for the neighborhoods are directly related to average household size in 1970. By 1980, the smallest average household sizes were found in Back Bay-Beacon Hill and Fenway-Kenmore, while the largest were in North and South Dorchester, Roslindale and Hyde Park.
- o The median value of owner-occupied non-condominium units declined by 5 percent when measured in constant 1980 dollars. Inflation-adjusted housing values leaped upward over 50 percent in South End, Fenway-Kenmore and Charlestown, where gentrification has been taking place. North and South Dorchester, Mattapan and Hyde Park had larger-than-average declines in values.
- o Between 1970 and 1980, median contract rent in Boston was essentially stable, rising by only one-half percent. Larger increases took place in Charlestown and Fenway-Kenmore, whereas declines occurred in the other planning districts.

Mobility

- o Boston residents in 1980 were more mobile than both Boston residents in 1970 and Massachusetts residents in 1980. The most mobile residents, measured by a change from where they had lived five years earlier, were found in Fenway-Kenmore, Back Bay-Beacon Hill, Allston-Brighton, Central and South End. In contrast, East Boston, Charlestown, South Boston, Roslindale, West Roxbury and Hyde Park residents were least mobile.
- o Over one-quarter of Boston households moved into their dwelling units in the year and a quarter preceding the 1980 census, and over half did so in the five years preceding the census. For Massachusetts the comparable proportions were 8 percent and 28 percent. Boston's mobility was due to the 73 percent rental households as well as the significant role of students and young adults in Boston's population. Among Fenway-Kenmore residents, 50 percent had moved in during the year and a quarter before 1980. The proportion was over 30 percent for the young adult areas of Back Bay-Beacon Hill, Allston-Brighton, South End and Central. Roslindale, West Roxbury and Hyde Park contained the lowest proportion of households that had recently moved.

Neighborhood Profiles - A Thumbnail Sketch

Boston and its neighborhoods today are extraordinarily complex, combining the descendants of 19th and early 20th century immigrants, a small old and new gentry, college students in large numbers, a new influx of young adults, largely professional and middle class, and the more recent growth and entry of black, hispanic and Asian populations. While the body of this report presents the detail and substance of the diversity of Boston's neighborhoods up to 1980, the following pages provide a summary portrait of their characteristics. These highlight similarities and differences in age, composition, ethnicity, household composition, income levels, occupation, and mobility. The thumbnail sketches introduce the more extensive analysis in the pages which follow, and serve as a preliminary guide to the story of Boston's neighborhoods.

South Boston, East Boston, Charlestown

As of 1980, South Boston, East Boston and Charlestown are neighborhoods with older, white residents living in traditional family arrangements and ethnic enclaves. The population under fifteen years old has declined, while persons over 55 are a rising proportion. About 60 percent of East Boston residents have Italian ancestry and 60 percent of Charlestown and South Boston residents are of Irish ancestry. A good majority of the households are families, belieing the national and Boston trend toward smaller, nonfamily households, i.e., one person, or two or more unrelated persons sharing a residence. Moreover, among nonfamily households, in these neighborhoods, a significant proportion are elderly singles, mostly widows and widowers. Residents of these three neighborhoods have lower levels of educational attainment, occupational skills, and income (excepting Charlestown) than the average Bostonian. East Boston and South Boston have the lowest proportions of college graduates of all neighborhoods among the population 25 years and older, 5 and 7 percent, respectively. More than 50 percent of East Boston adults have not graduated from high school.

The effect of gentrification on Charlestown is seen in the closer-to-city-average educational attainment, occupational distribution, and above average median income.

Residents of South Boston, East Boston and Charlestown are citizens of longer standing, with a smaller-than-city-average share having moved recently or having moved into Boston from the outside.

Roslindale, West Roxbury, Hyde Park

Roslindale, West Roxbury, and Hyde Park are also neighborhoods with residents of longer standing, lower mobility, high median ages and higher proportions of elderly. Residents are largely white, with a small but growing minority population. These neighborhoods differ from the previous grouping because they resemble suburban towns where residents are primarily in families, have higher incomes, greater educational attainment, more professional occupations, and therefore, reflect strong, middle-class, traditional values. Family households are dominant with a large proportion of husband-wife families. These three neighborhoods are among the four with the highest incomes in Boston. Educational levels are average or above, while there has been a gradual transformation of the occupational structure between 1970 and 1980.

Fenway-Kenmore

Fenway-Kenmore is unique among Boston neighborhoods because of the concentration of university students and young adults here. Over 80 percent of its population in 1980 is young adult: 27 percent is 15-19 years old, 38 percent is between 20-24, and 16 percent is 25-34. This leaves only 20 percent of the population to be distributed over all the ages under 15 and 35 and over. Some 13,000 persons out of a 31,000-person total live in college dormitories and other group quarters. The households occupied by the remainder of the population are 84 percent nonfamily, with high proportions of singles and roommates. Educational and occupational achievement levels are high, with 85 percent of adults 25 years and older being high school graduates, 41 percent college graduates, and 37 percent of workers employed in professional, technical and managerial occupations. Yet, household incomes are the lowest in Boston and residential turnover the highest by far, reflecting the presence of students.

Allston-Brighton

Allston-Brighton shares some of Fenway-Kenmore's characteristics: it has become an area of young adults, with half its population aged between 20-34 years in 1980. While it houses some 5,700 persons, mostly students, in group quarters, the young adults tend to be older and working. Again, high educational attainment and occupational skills prevail, as does high mobility, all characteristic of Boston's young adults. Two-thirds of the households are nonfamily, both singles and roommates. Minorities form small proportions, with Asians making up the largest minority group (some 3,000 persons). Household income is average for the City, because of above-average family income and below-average income of unrelated individuals. Allston-Brighton is one of Boston's growing neighborhoods.

Central, Back Bay-Beacon Hill

The Central area and Back Bay-Beacon Hill neighborhoods share several characteristics, including population growth during the 1970s. They are increasingly populated by young to middle-aged adults who are well educated, employed in high-level positions, and have high incomes. They are also extremely mobile reflecting a preponderance of young, nonfamily households.

Back Bay-Beacon Hill is an archetypal young professional neighborhood having many smaller households, two-worker families, young, mobile and professionally employed residents, and higher incomes.

While a high proportion of Central area residents share these characteristics, the area is more diverse. There are older adults as well as young ones. Chinatown is home to more than 3,000 people of Asian origin. Nearly 40 percent of households contain families. These characteristics reflect a more traditional, less affluent ethnic presence which gives the Central area residents a different dimension.

South End

South End is one of Boston's growth neighborhoods with two distinct types of population. There is a growing concentration of young to middle-aged adults, with high levels of educational attainment and occupational skills, resembling that of the Central and Back Bay-Beacon Hill neighborhoods. South End is also home to an expanding black, hispanic, and Asian minority population with a more traditional household structure and lower income. Forty percent of the population is white, 40 percent is black, with Asian and hispanic communities of over 3,000 persons each, together making up 20 percent of the total. Families make up 40 percent of all households. Of the families with children under 18 years, 46 percent are headed by single women. While incomes here have risen faster than those for Boston as a whole during the 1970s, the median family income is below the citywide median. The South End is one of Boston's most racially, ethnically, and economically diverse neighborhoods.

Jamaica Plain

Jamaica Plain, like the South End, is a neighborhood of whites and minorities, including blacks and hispanics. The age distribution is distinct with a higher proportion of children and elderly than in most Boston neighborhoods. The white population makes up 63 percent and blacks 20 percent of the total population. Nearly 7,800 persons or 20 percent are of hispanic origin forming the largest hispanic community in Boston. Over half the households are families. However, female-headed families with children comprise 46 percent of families with children, and 14 percent of all households. The educational attainment, occupational distribution, and incomes of nonfamily households are close

to the Boston average, while median family income is below the Boston average in 1980.

Roxbury, Mattapan

Roxbury and Mattapan have predominantly black populations (close to 80 percent) and large proportions of families with children. Some 7,700 or 13 percent of Roxbury's residents are of hispanic origin, making it the second largest hispanic community among the neighborhoods in 1980. Both have high percentages of children, teenagers and young adults. Nearly two-thirds of Roxbury households and nearly three-fourths of Mattapan households are families. Female-headed families in Roxbury make up 42 percent of all families and 60 percent of all families with children. For Mattapan, the comparable proportions are 32 percent and 47 percent, respectively.

However, the two areas have fared differently economically. Mattapan's median household income is above average while Roxbury's is the lowest among Boston's neighborhoods, with the exception of Fenway-Kenmore. Mattapan residents tend to hold somewhat higher-skilled jobs and some two-thirds of the residents are high school graduates. In Roxbury, about 55 percent of the adults are high school graduates, unemployment rates are high, labor-force participation is lower, and there is a greater concentration of the less-skilled occupations.

North Dorchester, South Dorchester

North and South Dorchester are both approximately two-thirds white. The minority population is concentrated in the western portion of both neighborhoods. South Dorchester has more than twice the population of its northern neighbor. The median age of both neighborhoods approximates that of the City--29 years. Both neighborhoods have relatively high proportions of 15-19 year-olds, have gained in numbers of young adults under 35, and have lost population in the older age-groups during the 1970s. This is reflected in their loss of 40 percent of the white population during the decade. Despite these losses, South Dorchester still has the largest number of white residents of any planning district. The black and hispanic populations in South Dorchester have increased rapidly. Both Dorchesters now house more than 3,000 hispanics.

Both neighborhoods have above average proportions of family households. Two-thirds of all households contain families, about 40 percent are made up of married couples, and almost 40 percent are families with children. Of the families with children, over 35 percent are headed by single women.

South Dorchester has a higher level of economic well-being than the city overall. South Dorchester has higher proportions of high school graduates and professional and related workers. North Dorchester ranks somewhat below the average, in terms of household and family income.

Acknowledgements

This comparison of 1970 and 1980 Census data for neighborhoods was made possible by the extensive work of Richard O'Hara, Anne Hafrey and Susan Jaster of the Boston Redevelopment Authority Research Department in compiling the data into the large number of tables contained in this report. Thanks is also due to Jeffrey Brown, Gregory Perkins and John Avault for their comments and suggestions. Susan Jaster has also offered helpful suggestions. Alex Ganz, Research Department Director, has guided census data acquisition and has requested this compilation.

Acknowledgement is also due to those who have investigated the problem of U.S. Census data sets that do not give precisely the same numbers for a given geographic area, including Greg Perkins, John Avault and Richard Ning of the Boston Regional Office, U.S. Bureau of the Census. The census numbers used in this report are drawn largely from Summary Tape File 3 data, which are sample data aggregated from the block group level to planning districts. These data are subject to suppression for small groups at the block group level to maintain confidentiality of respondents and to a statistical algorithm for inflating the sample to a 100 percent count. Summary Tape File 1 data are subject to block group level suppression but not to the inflation algorithm because STF 1 is complete (100%) count rather than sample data. Neighborhood Statistics Program (NSP) data are subject to suppression at the larger neighborhood area and to the inflation algorithm to the extent that they are based on sample rather than 100 percent counts. These differences in the way the various data sets are compiled from the 1980 U.S. Census account for discrepancies in the numbers reported herein.

The decade of the 1970s was a time of significant change in the City of Boston and its neighborhoods. While the number of housing units in Boston was stable, its population declined indicating a decrease in average household size. However, underlying these citywide trends were different patterns of stability and change in the sixteen neighborhoods that compose Boston. Indeed, the 1970-1980 decade has brought a transformation of the population of the City and many of its neighborhoods with regard to total numbers, race and ethnicity and social and economic characteristics.

This report, based on data from the 1970 and 1980 U.S. Census of Population and Housing, provides an overview of trends in the neighborhoods during the last decade. These neighborhoods are the Boston Redevelopment Authority planning districts used during the 1970s. Comparisons with the city as a whole are also provided. Subject matter includes population change, age, race, hispanic origin, ethnic heritage, marital status, family relationship, household composition, labor force status, occupation, industry, commute to work, income, poverty status, housing, and mobility. Boston Redevelopment Authority Research Department reports that analyze some of these topics in depth are noted in the text. This report is largely descriptive rather than analytical, but it highlights for the reader neighborhoods in which noteworthy change occurred, how this change compared to citywide trends, and some of the reasons behind the changes observed.

The most important changes between 1970 and 1980 were several related citywide shifts. These included a large increase in the number of young, working-age persons; more nonfamily households; a dramatic increase in educational attainment; and a labor force in which the typical worker held a professional, technical or managerial occupation and worked in the financial and professional services industries. All the neighborhoods shared in these

shifts to a greater or lesser extent. Growing numbers of minorities also have been a strong force in determining the social and economic character of several neighborhoods. At the same time, the presence of some 20,000 students in Boston has continued to shape the social and economic character of a few neighborhoods. These citywide shifts have paved the way for the population changes of the 1980s, which include overall population growth and further changes in characteristics.

II. Demographic Characteristics

Population Growth and Decline

Between 1970 and 1980, Boston's population declined by 12 percent to 562,994 persons. Two-thirds, or 12 of Boston's 16 neighborhoods also experienced declines, as seen in Table 1. North Dorchester, Mattapan, and South Dorchester had declines of 20 percent or more. Above average losses also occurred in East Boston, Charlestown, South Boston, Jamaica Plain, Roxbury, and Roslindale. Below average losses were seen in Fenway-Kenmore, West Roxbury, and Hyde Park. On the other hand, several neighborhoods gained population, i.e., South End (18.7 percent), Back Bay-Beacon Hill (9.4 percent), Central (6.6 percent), and Allston-Brighton (2.5 percent). Therefore, Boston's neighborhoods showed a wide range of population gain and loss. Losses occurred in most of the traditional neighborhoods while gains were shown by neighborhoods with large numbers of young adults and significant numbers of new and converted housing units.

Table 2 indicates the population living in households, i.e. occupied housing units, and group quarters, such as college dormitories and fraternities, nursing schools, orphanages, convents, penal institutions, and nursing homes. In most neighborhoods, the population in group quarters is small. However, it is large in areas with many students such as Fenway-Kenmore (13,052), Allston-Brighton (5,662), and Back Bay-Beacon Hill (5,354). The number of persons living in group quarters is essentially unchanged since 1970.

While the number of households was roughly stable between 1970 and 1980, the average number of persons living in households declined by 13 percent to 2.4 persons per household. This decline in household size is the source of Boston's population loss. Table 3 shows that household size declined in every neighborhood except Fenway-Kenmore. In addition, only minimal declines

occurred in Back Bay-Beacon Hill and South End. Other neighborhoods had considerable shrinkage in household size due to a variety of reasons; including a larger number of elderly and young adults living alone, an increase in non-family households, increasing divorce rates, and fewer births and children in families. These trends are discussed further in the sections about age distribution, household relationship, and household composition.

Sex Ratios

During the 1970-1980 decade, Boston's sex ratio increased to 89 males per 100 females from the 85 to 100 ratio of 1970. This was a significant change when compared to the national sex ratio trend which declined from 94.8 to 94.5 males per 100 females. The small national decline resulted from the greater increased life expectancy for women than for men being partially offset by improved census counts of males in 1980 compared to 1970, especially young adult, minority males.

A number of factors have contributed to Boston's increasing sex ratio including better census counting in 1980 and a relatively young age distribution, with a decline in the numbers and percentage of elderly.

However, when Table 4 is compared to Table 5, the relationship between increasing sex ratios and changes in median age is not very close. Instead the explanation rests with the tendency of relatively more males in the ages from 15 to 64 to live in Boston. Indeed, it is the dramatic increase in the numbers of males in the 20-34 age group which is the linchpin of this change. Young males increased by over 20,000 compared to an increase of less than 12,000 increase for females in these age groups. This trend is related to the change in lifestyles among young adults for whom marriage, childbearing, and moves to the suburbs are lower priorities than they were in previous decades.

The information about sex ratios by age group, extracted from Tables 14 to 15, corroborates the information from Table 4 about sex ratios by neighborhood. The male population has grown significantly faster than the female population in planning districts with a high proportion of young adults, including Central, Back Bay-Beacon Hill, South End, Fenway-Kenmore, and Allston-Brighton.

Median Age

The median age of Boston residents remained relatively stable at 28.9 years in 1980 compared to 28.1 years in 1970. This shows a population aging more slowly than that of the Boston SMSA and the nation because of the immigration of young adults. The average age of both metro Boston and the nation rose about two years during the decade to 31.3 years and 30.0 years, respectively. However, around Boston's fairly stable median age, the neighborhood medians varied and the age distribution of Boston and its neighborhoods changed enormously.

The median age of neighborhood residents in Table 5 varied considerably. These neighborhoods were led by West Roxbury (39.3 years) and Central (38.6 years), followed by East Boston, South Boston, Hyde Park and Charlestown. With the exception of Central, these neighborhoods tended to have older, white residents. These traditionally family neighborhoods have lost children (who grew up and moved) to other areas, forming households for themselves. Neighborhoods with median ages that approximated the citywide median included Jamaica Plain-Parker Hill, South End, North Dorchester, and South Dorchester where there has been a recent turnover to young adult minority and non-minority residents. Back Bay-Beacon Hill contrasted as a neighborhood that aged to Boston's median as residential turnover has brought in an older group of young adults. Fenway-Kenmore and Allston-Brighton, with high proportions of college students and young adults, remained below the average. Roxbury and Mattapan

medians were below Boston's average due to a large number of minority families with children.

Age Distribution

In 1980, Boston's age distribution centered on the 20-34 year age groups. One-in-three persons was in this age group in 1980 compared to one-in-four persons in 1970, as seen in Tables 7 and 9. This is a result of the Baby Boomers being concentrated in these ages and the immigration of young adults seeking higher education and careers. All other age groups, whether older or younger, have shrunk as a proportion of the total except for the 15-19 year and 75 year and older groups. In 1980, one-sixth of the population was 15 or younger compared to one-fourth in 1970. The proportions in the middle age groups have declined slightly while the proportion of elderly has been stable. In numbers, Table 10 shows that Boston gained some 32,000 20-34 year olds while losing 110,000 persons in other age groups for a net loss of 78,000 persons during the decade. Table 11 shows that Boston's largest percentage losses between 1970 and 1980 were among children. The average loss for the 0-14 age group was 37 percent, which was due to both fewer births and net out-migration.

In general, the neighborhoods followed the city-wide 1970-80 pattern of loss for those under 20 years and those aged 35 to 74, and of gain for those 20-34 years and 75 and over. Notable variations in these trends and exceptions will be mentioned here.

Among children under 15, the largest percentage losses occurred in the traditional neighborhoods of East Boston, Charlestown, South Boston and West Roxbury. High losses also occurred in Fenway-Kenmore and Allston-Brighton where the numbers of young college students and singles were increasing. Areas that bucked the trend and showed small increases in children 10-14 years were South End and Back Bay-Beacon Hill. Increases in 15-19 year olds occurred in

South End, Mattapan and Roxbury where there were large numbers of minority youth.

Table 7 shows that the neighborhoods with the highest proportion of children under 10 years of age were Roxbury (17 percent), Mattapan (17 percent), and Jamaica Plain-Parker Hill (13 percent) despite their considerable losses seen in Tables 10 and 11. Mattapan and Roxbury had the highest proportions of 10-14 year olds also, followed by North and South Dorchester. While Fenway-Kenmore had the highest proportion, 27 percent, of 15-19 year olds among the planning districts because of its transient student population, Mattapan, Roxbury, and North and South Dorchester were also above the citywide average. Therefore, children and adolescents were increasingly located in areas that had predominantly minority populations, as seen in Tables 12 and 13.

One-third of Boston's population was aged 20-34 in 1980. However, over half of the population in Back Bay-Beacon Hill, Allston-Brighton, and Fenway-Kenmore was in this age group. In terms of numbers, Allston-Brighton had the most young adults, some 33,000. Large numbers of young adults were also found in Fenway-Kenmore and Back Bay-Beacon Hill, some 17,000 each, and Roxbury and South Dorchester, with about 15,000 each. While the 20-24 year olds were clustered in Allston-Brighton and Fenway-Kenmore, where many college students live, the 25-34 year olds were more dispersed. Neighborhoods with the highest proportions of 25-34 year olds were Back Bay, with one-third, and Central, South End, and Allston-Brighton with one-quarter each.

The areas with the largest percentage increases in 25-34 year olds were South End, Back Bay-Beacon Hill, Allston-Brighton, and Central, with 107 percent, 83 percent, 78 percent, and 72 percent, respectively. On the other hand, East Boston, Roxbury, North Dorchester, and Mattapan had increases of less than 10 percent among 25-34 year olds compared to a 35 percent increase city-wide. While all neighborhoods have gained in both numbers and proportions

of young adults, the range of increase showed the appeal of various neighborhoods to young adults. The new Bostonians who are young adults with high-level education, skills, and occupations have been disproportionately attracted to areas adjacent to areas of growing employment in finance, education, health and other high-level services.

The number of people 35-54 declined by 20 percent in Boston between 1970 and 1980, 35-44 year olds dropped by some 13 percent, and 45-54 year olds decreased by 26 percent. These losses implied a slowing of out migration compared to the two previous decades. Movement to the suburbs for both better educational opportunities for children and housing has been an important factor. The planning districts with the greatest loss in these age groups included Roslindale, with a 34 percent loss, Hyde Park, North Dorchester and East Boston. Fenway-Kenmore also lost a high proportion, 45 percent, of its 45-54 year old residents.

However, a number of planning districts gained middle aged residents, Back Bay-Beacon Hill gained both 35-44 and 45-54 year olds while Central, South End, and Mattapan had gains among the 35-44 year age group. These four planning districts had the highest proportions of 35-44 year olds in Boston, some 2 to 4 percent above the Boston average of 9.4 percent. However, the neighborhoods with high proportions of 45-54 year olds were East Boston at 11.3 percent, with Charlestown, Central, West Roxbury and Hyde Park close behind. In contrast, only 2.7 percent of the Fenway-Kenmore population fell in this age group compared to 8.7 percent citywide.

Between 1970 and 1980, Boston lost close to 20 percent of both the 55-64 year and 65-74 year age groups. Moreover, the patterns of gain and loss for these two age groups was remarkably similar. In 1980, 9 percent of Boston's population was 55-64 years old and 7 percent was 65-74 years of age. However, East Boston and West Roxbury had notable proportions of these older age groups. Among East Bostonians 13.3 percent were 55-64 years old and 9.9 percent were 65-74 years old. In West Roxbury, 12.9 percent were 55-64 years of age and 12.5 percent were 65-74 years old. Above average proportions of both age groups were found in Charlestown, South Boston, Central, Hyde Park, and Roslindale.

Several of these neighborhoods showed gains in these age groups in contrast to the citywide loss: East Boston, Central, Hyde Park, and, for the 65-74 year group, West Roxbury. At the other end of the spectrum, large losses occurred in Mattapan, Fenway-Kenmore, Allston-Brighton, Jamaica Plain-Parker Hill, and South Dorchester.

While less than 6 percent of Boston's population is very elderly, i.e., 75 years and older, the proportions in Table 7 range from 9.5 percent in West Roxbury and 8.6 percent in Roslindale to near 3 percent in Mattapan and Fenway-Kenmore. West Roxbury has experienced the largest growth and Mattapan the largest loss among this age group, nearly 50 percent in both cases.¹

¹ For a detailed description of Boston's elderly population, see Richard S. O'Hara, Jr., "The Boston Elderly, by Neighborhood, Race and Ethnic Origin", Research Department, Boston Redevelopment Authority, February 1983.

Several patterns of age distribution change since 1970 characterize the individual neighborhoods. While all neighborhoods have experienced a proportionate loss of children, above these ages three different patterns of change can be discerned by comparing Tables 7 and 9. First, there is a pattern of increase of both young adults and older people, with several variations on this pattern. In East Boston, South Boston, Hyde Park and West Roxbury, young adults through age 35 and older adults of 55 or 60 years and over grew as a proportion of neighborhood populations. In Roxbury and North Dorchester, this pattern was modified by a loss and stability, respectively, in the population over 65 years of age. For Central, the gains among younger adults extended to age 45. For Allston-Brighton, Jamaica Plain-Parker Hill, and South Dorchester, gains among younger adults extended to age 45 and gains among older adults were confined to those 75 years and older.

The second pattern is an increasing proportion of young adults and a decreasing or stable proportion of residents in the older ages. For instance, South End, Fenway-Kenmore, and Mattapan have proportional losses in the population aged 45 and over, while Charlestown has had a stable population 45 years and older. In Roslindale, proportional loss has occurred in all age groups 35 years or older. The third pattern is unique to Back Bay-Beacon Hill: loss among 15-24 year olds, gains among those 25-54 years of age, and loss for those 55 years and older.

Racial Composition

The racial composition of Boston changed moderately during the 1970-1980 decade. Tables 16 and 20 show that whites declined as a proportion of the total population from 82 percent to 70 percent. Blacks increased from 16 to 22 percent of the total while Asian and Pacific Islanders grew from 1.6 to 2.7 percent. Native Americans remained at 0.2 percent of the population while

other races increased from 0.3 to 4.7 percent, reflecting the tendency of some hispanics to indicate their race as other rather than as white or black in 1980. This tendency probably reduced slightly the proportion recorded as white or black in 1980.

Of the 562,994 persons counted in 1980, 393,937 were white, a decline of some 25 percent. Blacks numbered 126,229, a gain of 21 percent. Asian and Pacific Islanders increased 44 percent to 15,150 while Native Americans grew by 24 percent to 1,302. Some 26,000 "Other races" were also counted, as seen in Table 16.

All neighborhoods had a lower proportion of whites in 1980 than in 1970 (Table 21). The highest proportions of whites, some 98 percent, were still found in East Boston, Charlestown, South Boston, and West Roxbury. Table 18 shows that Roxbury and Mattapan had the lowest proportion of whites at 10 percent and 15 percent, respectively.

The largest numbers of whites were still found in Allston-Brighton and South Dorchester. Table 17 shows that the smallest numbers of whites lived in Roxbury and Mattapan, less than 6,000 in each. The largest proportional losses were in these two planning districts also, at 66 and 76 percent, respectively. Table 21 also shows that North and South Dorchester lost over 40 percent of their white residents between 1970 and 1980. On the other hand, the white population of Back Bay-Beacon Hill grew by 5 percent while Central and South End lost only 1 percent or less of their white residents.

During the 1970-80 decade, Boston's black population increased by 22,000 to 126,000 persons, or by some 21 percent (Table 22). The neighborhoods with the largest enclaves of blacks were Roxbury with 45,000, Mattapan with 29,000, South Dorchester with 16,000, and South End with 11,000 black residents. The proportions black of total population in these neighborhoods were 78 percent, 81 percent, 28 percent and 41 percent, respectively. Blacks in these planning

districts comprised 80 percent of all Boston's black population, compared to 84 percent in 1970. However, they were not necessarily the neighborhoods with the largest proportional increases during the decade. Hyde Park had the largest increase in blacks, nearly thirty-fold to 3,864 persons or 13 percent of the neighborhood population. Neighborhoods with increases of some 100 percent include Central, Allston-Brighton, South Dorchester, West Roxbury, and Back Bay-Beacon Hill. However, the resulting numbers were small except in South Dorchester, as mentioned above. Of the other neighborhoods with sizeable black populations, Mattapan's blacks increased by 56 percent and South End's by 55 percent, yet Roxbury's blacks declined by 15 percent. Roxbury was the only neighborhood with a large black population to show a decline. Declines among blacks also occurred in East Boston, Charlestown, and South Boston. In these neighborhoods, the very low numbers of black residents in these neighborhoods in 1970 were substantially diminished by the fear of repercussions from the sometimes tragic race relations events of the decade.

The population of Asians and Pacific Islanders in Boston grew by over one-half to 13,107 persons. In 1980, Table 23 shows that the neighborhoods with the largest Asian populations, 3,000 or more, included Central, Allston-Brighton, and South End. The Asian population of these neighborhoods included nearly three-fourths of all Boston's Asians in 1980 compared to two-thirds in 1970. Central and Allston-Brighton showed increases of about 140 percent during the decade. The number of Asians in the South End increased by only 10 percent between 1970 and 1980. South Boston, Roxbury, and North and South Dorchester actually lost some of their small Asian populations.

The hispanic population of Boston has doubled to some 36,000 during the 1970-1980 decade. Some of this increase, shown in Table 24, is due to better census counting and an increased willingness by respondents to indicate their hispanic identity. The largest enclaves of hispanics were located in Roxbury

and Jamaica Plain by both censuses. Together they comprised 43 percent of the City's hispanics in both 1970 and 1980. Table 24 shows that large groups of hispanics were also found in South Dorchester, South End, North Dorchester and Allston-Brighton, with close to 3,000 or more in each. Mattapan, Fenway-Kenmore, and Roslindale each had over 1,000 hispanic residents in 1980. South Dorchester and Roslindale are newcomers to the list of planning districts housing 1,000 or more hispanics. These two neighborhoods, along with West Roxbury, experienced the highest proportional increase in hispanics, over 200 percent, with some 581 percent for West Roxbury because of its tiny number in 1970. All the other planning districts except South Boston had increases as well.

Language Spoken at Home and Ability to Speak English

Nearly 82 percent of Boston's 1980 population aged 5 years and older, some 435,000 persons, spoke English only. Some 98,000 persons or 18 percent spoke a language other than English at home as reported in Table 25. This included 5 percent Spanish speakers and 13 percent who spoke other languages at home. Additionally, 14 percent spoke English well, but 4 percent spoke English either not well or not at all.

Planning districts with above average proportions of other language speakers were East Boston, Central, South End, Allston-Brighton, Jamaica Plain, North Dorchester and Roslindale. However, many of those who spoke another language at home spoke English well. For instance, there were large numbers of Spanish speakers in Jamaica Plain, Roxbury, Allston-Brighton, South End, South Dorchester, Mattapan, and North Dorchester. However, the number of essentially Spanish-only speakers was much smaller. There were some 2,000 each in Jamaica Plain and Roxbury among other language groups with non-English speakers, there were over 2,500 each in Central, 2,200 in Allston-Brighton and 1,500 in South

End who were principally Chinese and other Asians. (We note that there is some evidence of undercounting of this group.) In East Boston, the 1,400 non-English speakers were predominantly Italian. In North Dorchester, Cape Verdean/Portuguese and Polish speakers were significant, as were Greeks, Lebanese, and Syrians in Roslindale.

The variety of languages spoken and ethnic groups represented above speaks of the diversity among neighborhoods in a cosmopolitan Boston. Because no comparable question was asked in the 1970 census, comparisons are not presented.

Ancestry

Tables 26 and 27 present census information on ancestry, i.e., a person's self-identified nationality, descent, or country of origin. Among Boston's population, 375,000 or some 67 percent identified themselves as having a single ancestry group with 38 percent being of the European nationalities shown in Tables 24 and 25. Of these, Irish and Italians predominated with 16 and 9 percent of the total, respectively. Some 28 percent of Bostonians named a single ancestry group not specified on the list. Among the 20 percent of Boston residents who indicated multiple-ancestry, half were English/Other. Another 10 percent did not indicate their ancestry and 4 percent indicated a religious or other non-national ancestry. Boston's two largest identifiable ancestry groups were Irish and Italian which were claimed as a single- or partial-ancestry by 27 percent and 12 percent of the population, respectively.

The neighborhoods showed enormous variability in the proportion of their residents who claimed various ancestry groups. For instance, 52 percent of East Boston and 28 percent of Central, ostensibly North End, residents were of pure Italian ancestry, with an additional 10 and 8 percent, respectively, of

mixed Italian descent. Another 19 percent of Central residents indicated an unspecified single-ancestry group, probably mainly Chinese or other Asian nationalities.

Irish is the predominant nationality in quite a few neighborhoods. In Charlestown and South Boston, Irish descendants formed 40 percent of the population and those of mixed Irish descent another 20 percent. In West Roxbury, the proportion of Irish was 34 percent and mixed Irish 16 percent, with pure Italian and mixed English at 7 percent each. In North and South Dorchester, Roslindale and Hyde Park nearly a quarter are pure Irish with some additional 15 percent of mixed Irish background.

Ancestry other than the specified European nationalities were important in the latter four neighborhoods. Poles and Greeks formed small but noteworthy groups in North Dorchester and Roslindale, respectively. In these four neighborhoods, "Other" also accounted for a high proportion of the population. The probable elements of "Other" for these neighborhoods sounds like the United Nations: Puerto Rican, Cape Verdean, and other European nationalities in North Dorchester, a polyglot of ancestries in South Dorchester; Canadian, Russian, Lebanese and other Middle Eastern nationalities in Roslindale; and Canadian, East European, and Middle Eastern backgrounds in Hyde Park. Back Bay-Beacon Hill had noteworthy numbers of English and Irish, of both pure and mixed descent. Fenway-Kenmore was another polyglot of backgrounds, largely reflecting the diversity of university populations.

The "Other" category formed the largest reported ancestry group for Roxbury (75 percent), Mattapan (67 percent), and South End (49 percent). The primary components of Other here are African or American with some Chinese and other Asians in South End.

Marital Status

Table 28 shows the distribution of Boston's men and women aged 15 or older by marital status. Of the nearly 217,000 men resident in Boston in 1980, 110,000 or some 51 percent were single (never married) while 82,000 (38 percent) were currently married. The proportions of separated, widowed, and divorced men were relatively small, 11 percent combined. Among the 251,000 women, 108,000 or 43 percent reported being single while another 80,000 (32 percent) responded that they were married. In addition, some 33,000 reported being widowed while about 29,000 were separated or divorced.

The various neighborhoods had very different distributions of marital statuses and these different distributions related to the age distribution in each area. Areas with high proportions of students, Fenway-Kenmore and Allston-Brighton, had very high proportions single. Areas of young adults, like Central, Back Bay-Beacon Hill, South End, and Jamaica Plain had high proportions of singles also. Roxbury and Mattapan tended to have singles overrepresented as well largely due to the high numbers of older teenagers. The areas with higher-than-average proportions of married persons tended to be East Boston, South Dorchester, Roslindale, West Roxbury, and Hyde Park. The largest numbers of widows were found in Allston-Brighton and South Dorchester but their proportions were highest in Roslindale, South Boston, and West Roxbury. While divorced men were most concentrated in Back Bay-Beacon Hill, divorced women were most often found in Roxbury.

Household Relationship

Households were divided into two major categories: family and nonfamily. Family households contained two or more persons related by blood, marriage, or

adoption. Households that did not meet this definition are considered nonfamily.

Comparison of the household relationship of Boston residents in 1970 and 1980 revealed important changes that reflect nationwide trends. Overall, there was a tendency for an increase in the number of household heads, especially in nonfamily households, and a decrease in the number of children. However, comparisons of the 1970 and 1980 data were limited by a change in the categories of household relationship, evident in Tables 29 through 32. The principal changes in 1980 were to 1) separate "own children" from "other relatives of head" in families, 2) separate non-relatives in family households from those in nonfamily households, and 3) separate nonfamily heads living alone from those heading multi-person households.

Husbands and wives each comprised 13 percent of Boston's population down from 16 percent in 1970. As indicated by the marital status distribution, the highest proportion of husbands and wives living together continued to be in East Boston, Roslindale, West Roxbury, and Hyde Park. The proportion of persons who were children in families declined appreciably city-wide, from 35 to 29 percent of the total. Moreover, the number of those under 15 declined in every neighborhood, although data were not available for own children of head by neighborhood.

Persons in all other household relationship categories increased. Female heads of family households increased from 32,000 to 35,000, and from 5.0 percent to 6.3 percent of the population. This increase was seen in all neighborhoods. Roxbury and South Dorchester continued to have the largest numbers of female heads of household followed by Jamaica Plain and Mattapan. In percentage terms, Roxbury led the list, followed by Mattapan, then South Boston, North Dorchester, Jamaica Plain, and South Dorchester. This general

ordering of neighborhoods by proportion of persons who were female householders was unchanged from 1970.

Members of nonfamily households grew by 40 percent, while the number of heads of nonfamily households grew by one-third. In general, the increases in heads of nonfamily households between 1970 and 1980 were inversely related to the proportion of the population which headed nonfamily households. For instance, the increase was only 10 percent in Back Bay-Beacon Hill and Fenway-Kenmore but nearly 100 percent in East Boston, Charlestown, West Roxbury and Hyde Park. The proportion of the population that were nonfamily household heads in 1980 was highest, as expected, in Back Bay-Beacon Hill (44 percent), Central and Fenway-Kenmore (31 percent), and South End and Allston-Brighton (27 percent). Roommates added another 6 to 15 percent of total population to nonfamily household residents.

The number of persons in group quarters had not changed appreciably between 1970 and 1980. A 10 percent decline in inmates of institutions, principally in Roslindale, Roxbury, Jamaica Plain, and South End, was balanced by a 3 percent gain in other group quarters populations. The latter was primarily found in Central, Allston-Brighton, and Back Bay-Beacon Hill and included both dormitory populations and the homeless.

Household Composition

The trends in household composition between 1970 and 1980 parallel those documented in the Household Relationship section. However, focusing on the household, i.e., occupied housing unit, as the unit of analysis rather than persons according to their relationship within a household sharpens the trends considerably. Because the unit of analysis in this section is the household, group quarters are not considered here. This excludes the living arrangements of some 40,000 persons or 7 percent of Boston's population. Excluding group

quarters is significant only for Fenway-Kenmore, Allston-Brighton, and Back Bay-Beacon Hill where many college dormitories are located.

The discussion presented here is summarized and adapted from a more extensive BRA Research Department publication on the subject.² The reader is referred to it for greater detail.

Boston's shifts in age distribution and in household composition parallel nation-wide trends toward increasing numbers of young adults and smaller, increasingly nonfamily households. Household size declined 13 percent in Boston and nationwide. Persons aged 20 to 34 years old grew to 33 percent of the population of Boston from 24 percent in 1970. Nationwide, the share of young adults 20 to 34 years old swelled from 20 to 26 percent.

A number of factors have contributed to the shifts in household type locally and nationally. Most important is the aging of the post-World War II Baby Boom cohorts from adolescence and their early twenties, when many were children within their parents' households, to the independence of more mature, young adults. Trends toward later marriage and childbearing within this group have also been important. Rapidly rising divorce rates, which have recently leveled off, are another important factor. The increasing longevity of the elderly and their improved financial condition on average have also contributed to a larger percentage of elderly living independently.

A unique combination of other factors have augmented this trend in Boston. These factors include the attraction of Boston's numerous colleges and universities for young adults, the expanding number of jobs in the services sector, and the ambiance of a vital city that appeals to many young persons. On the other hand, Boston's public schools lagged

² Margaret C. O'Brien, "The Changing Household Composition of Boston, Its Neighborhoods and Selected Minority Groups", November 1983.

behind other educational systems in recent decades making Boston less attractive to many families with children.

Table 33 shows that there were 218,457 households in Boston in 1980, a marginal increase, 0.4 percent, over the 217,622 households of 1970. Of these households, 53 percent were occupied by families, down from 65 percent in 1970. The number of family households, those with two or more persons related by blood, marriage, or adoption, has declined some 17 percent from 141,000 to 116,000. Nonfamily households, i.e., individuals living alone or with other unrelated individuals, have increased from a corresponding 35 percent to 47 percent of all households in 1980. This represents an increase of one-third between 1970 and 1980 to over 102,000 non-family households.

For households within the family category, more extreme changes are observed. Married couples with children have declined the most, by 35 percent, to 34,000 households or 15 percent of the total. The dramatic decline in fertility since 1964 has brought about this change. All married couples have declined by 28 percent, until in 1980 they comprised one-third of Boston's households. Other family households, those lacking a married couple, now comprise 20 percent of all households. Other families include those with a single parent and children, siblings living together, or a householder with an older relative. One category of "other family," female-headed households with children under 18 years now comprised 10 percent of all Boston households.

This shift was the result of both the decline in married couple families with children and the increase in female, single-parent families. The aging of much of the Baby Boom cohort to beyond age 18, delayed marriage and childbearing of many young adults, and a rapid

increase in rates of divorce and separation among those married fostered these trends. Moreover, Boston's mix of urban amenities, housing, and public services has had limited appeal to families with children.

Specific types of non-family households have shown dramatic change as well. The largest increases of 104 percent and 42 percent occurred among male-headed, one- and multi-person households, respectively, who together comprised 20 percent of 1980 households. Nonetheless, the largest group of nonfamily households in 1980 continued to be females living alone who formed 21 percent of all Boston households. The increases among elderly, nonfamily households has been small, while all elderly-headed households declined by perhaps some 5 percent. This was due to the countervailing trends of an increased tendency for elderly to live alone and to a decline of 10,000 or 13 percent in the number of elderly during the 1970 decade. The last is largely due to smaller cohorts reaching age 65 or beyond as a result of their migration out of Boston in earlier decades.

The neighborhoods of Boston show great diversity in their household composition compared to the city as a whole. While it is possible to examine the composition of each individual neighborhood from Tables 36-51, the highlights indicated by the planning district summary sheets, Tables 34 and 35, will be described here.

Slightly more than half of Boston's households were families in 1980. However, some neighborhoods had much higher proportions of family households while other neighborhoods had lower proportions. There were three distinct groups of neighborhoods as measured by the proportion of households occupied by families. In eight of sixteen neighborhoods, the proportion of family households was close to two-thirds or more. These included East Boston, Roxbury, North Dorchester, South Dorchester,

Roslindale, West Roxbury, Hyde Park, and Mattapan. In three more neighborhoods, Charlestown, South Boston, and Jamaica Plain, families occupied between 50 and 60 percent of all households. However, the proportion dropped below 40 percent for Central, South End, and Allston-Brighton, and to 20 percent or less in Back Bay-Beacon Hill and Fenway-Kenmore. The neighborhoods with a high family orientation spanned the city geographically and included a broad spectrum of ethnic and income groups. Those with relatively few families were the neighborhoods that had a higher proportion of young adults 20-34 years than did Boston as a whole. Nonetheless, the proportion of family households fell between 1970 and 1980 for all neighborhoods.

The proportion of married couples with children declined in all neighborhoods also. Indeed, in no neighborhood was the proportion of households in such families greater than 25 percent in 1980. Those with 20 percent or more of their households occupied by traditional families included East Boston, North and South Dorchester, Roslindale, West Roxbury, Hyde Park, and Mattapan. At the other end of the spectrum were the neighborhoods in which young adults predominate. In Fenway-Kenmore and Back Bay-Beacon Hill, about 3 percent of households contained married couples and children. For Central and Allston-Brighton, the proportion approximated 9 percent.

On the other hand, "other" families with children under 18 years grew in both numbers and proportion in all neighborhoods during the 1970-1980 decade. In 1980, they comprised 11 percent of the households city-wide, with 10 percent headed by women and 1 percent headed by men.

Several neighborhoods had higher-than-average proportions of families with minor children headed by women. In Roxbury and Mattapan, they formed 27 and 23 percent, respectively, of total households. In

North and South Dorchester and Jamaica Plain, the proportion was 14 to 15 percent. The neighborhoods with the lowest proportions were again Central, Back Bay-Beacon Hill, Fenway-Kenmore, and Allston-Brighton, plus West Roxbury. With the exception of West Roxbury, this was due to the low proportion of family households rather than to a low proportion of single parent households among family households.

The proportion of female-headed to all family households with minor children was 38 percent for Boston in 1980 compared to 23 percent in 1970. The proportion ranged from 13 percent in West Roxbury to 60 percent in Roxbury. It was 40 percent or higher in South Boston, South End, Jamaica Plain, North Dorchester, and Mattapan.

Nearly half of Boston households were nonfamilies in 1980. The neighborhoods with a high proportion of nonfamily households, i.e., persons living alone or with roommates, were those with low proportions of family households, to wit, Fenway-Kenmore (84 percent), Back Bay-Beacon Hill (80 percent), Allston-Brighton (67 percent), and Central (62 percent). Nonfamilies formed less than 35 percent of the households in East Boston, Roxbury, North Dorchester, South Dorchester, and the suburban-like neighborhoods. All neighborhoods experienced an increase in the proportion and numbers of nonfamily households between 1970 and 1980. However, the amount of increase varied widely by neighborhood. There was no pattern to the size of the increase with regard to neighborhood character or 1980 proportion of nonfamily households because different reasons were responsible for the growth in nonfamily households in various neighborhoods. These reasons include the growth in young adults, their tendency to delay marriage and childbearing, the increasing number of divorced persons, and the increasing tendency of the elderly to live independently of other family members cited before.

In addition, the construction of housing units suitable for only one or two persons has been a contributing factor.

In 1980, over one-in-three Boston households contained only one person. One-in-five contained a single female. One-in-ten contained two or more roommates. As might be expected, the highest proportions of roommate households were in areas with heavy concentrations of students and young adults, namely Fenway-Kenmore, Allston-Brighton and Back Bay-Beacon Hill. The highest proportions of singles were in the burgeoning young adult neighborhoods of Back Bay-Beacon Hill, Fenway-Kenmore, Central, South End and Allston-Brighton. These neighborhoods tended to have higher proportions of single females as well, reflecting the attractiveness of these areas for Boston's many women workers. The high proportion of single female households in South Boston probably indicated more widows.

Indeed, the neighborhoods with high proportions of elderly single people were quite different. They included South Boston (16 percent), West Roxbury (15 percent), and East Boston, Roslindale and Charlestown (13 percent each). On the other hand, in Mattapan, Roxbury, and Back Bay-Beacon Hill, well under ten percent of the households were occupied by persons 65 years and over living alone. The proportion of elderly singles in a neighborhood was related to the total number of households in that neighborhood headed by elderly persons. In general, single elderly occupied one-half to two-thirds of elderly-headed households in any neighborhood. The exceptions were Fenway-Kenmore where three-out-of-four elderly households lived alone, and the four suburban neighborhoods of Roslindale, West Roxbury, Hyde Park and Mattapan where the proportion was closer to 40 percent.

- 1 Persons may be counted more than once in the selected multiple ancestry groups shown below, or not counted if not in one of the selected groups.
- 2 All persons are the sum of all single ancestry groups, multiple, not specified-other, and not specified-not reported. Selected multiple ancestry groups are not summed to the neighborhood totals for the reasons cited in footnote 1. Percents are presented for selected multiple ancestry groups so that the reader may know those of a particular ancestry, whether the respondent claimed this as his sole ancestry or indicated that he/she was of this and other ancestries.

III. Labor Force

Education

The amount of education an individual has received is an important determinant of the opportunities available to him or her throughout life, particularly in the workplace. The educational attainment of adults aged 25 years or older is both an important measure of the educational level of the population and a key to understanding labor force characteristics. The change that occurred in this measure between 1970 and 1980 is significant, as seen in Tables 52 through 55.

In general, there was a significant decline in the numbers and proportion of the population with less than a high school education, stability in the proportion of high school graduates, and a noteworthy increase in those with college level education. In 1970, 26 percent of Boston's adults had an elementary education or less. By 1980, this proportion was reduced to less than 17 percent. Similarly, the proportion with 1-3 years of high school declined from 20 to 15 percent. In the pivotal category, high school graduates, the proportion edged upward to 35 percent from 34 percent. Adults 25 years or older, with some college, increased by two-thirds between 1970 and 1980, from 19 percent to 33 percent. More significantly, the proportion of those who had completed four years of college or had gone on to graduate studies doubled to 20 percent. These remarkable changes were reflected in most of Boston's neighborhoods. Moreover, they provide important background information for understanding the transformation of Boston's workforce.

There had been a dramatic increase in the educational attainment of adults in all neighborhoods. However, great disparity remained between the neighborhoods with regard to attainment in 1980. For instance, 62 percent of Back Bay-Beacon Hill residents completed 4 years or more of college. This was true for 41 percent of the residents in Fenway-Kenmore, 34 percent of those in

Central, and 33 percent of Allston-Brighton residents. At the other end of the spectrum, very small proportions of residents had completed at least four years of college in East Boston (5 percent), South Boston (7 percent), Roxbury, Mattapan and North Dorchester (8 percent each).

Again, examining the proportions of neighborhood residents 25 years or older who had at least graduated from high school, whether or not they went on to college, uncovered important disparities. The proportions with a high school degree or more in 1980 were highest for Back Bay-Beacon Hill (94 percent), Fenway-Kenmore (85 percent), and for Allston-Brighton and West Roxbury (79 percent each). The proportion declined to about two-thirds for most neighborhoods. At the low end were East Boston (48 percent) and Roxbury (55 percent).

The reasons for these disparities were several. Some areas, such as Back Bay-Beacon Hill, West Roxbury and Allston-Brighton, had high proportions of residents with at least a high school diploma from which to build in 1970. Fenway-Kenmore advanced rapidly because of an increase in young adults pursuing careers and education beyond the undergraduate level. This was important for Central and the South End also. Other neighborhoods like East Boston and Roxbury simply lagged the city-wide average in both 1970 and 1980. Such neighborhoods may have had high proportions of immigrants, either long term residents or newcomers, who lacked the opportunity for education in their homeland. Others have residents who were unable to pursue education for other reasons. The labor force participation, occupational distribution, and income levels of these neighborhoods reflected this.

Participation, Employment, Unemployment, Workers Per Family

A detailed review of Boston's labor force from the Census showed size of the labor force, participation rates, counts of the employed and unemployed, unemployment rates, and number of workers per family. In addition, these characteristics were analyzed separately for neighborhoods by sex, and for racial groups. Some highlights of findings showed that the Boston female labor force participation rate continued to climb, unemployment rates were higher for blacks and hispanics than other racial groups, and many neighborhoods were showing significant numbers of two-worker family households.

Boston residents in the civilian labor force in 1980 numbered nearly 273,000 in 1980, a decline of only 2 percent from Boston's 279,000 civilian workers in 1970 despite a 12 percent population loss. The labor force was comprised of 256,000 employed and about 17,000 unemployed residents. The labor force participation rate of those aged 16 years and over rose somewhat from 58.5 percent to 60.0 percent, increasing the already high participation rate. Female participation rose from 47.8 percent to 52.7 percent, while participation among males declined from 72.0 percent to 68.5 percent. Boston labor force participation rate was slightly below those for the metropolitan area, state and nation because of the larger number of students and elderly in the adult population and the greater share of minority population.

Tables 56 and 57 indicate participation and unemployment rates for Boston's neighborhoods. The highest participation rates were recorded in 1980 for Back Bay-Beacon Hill (71 percent) and Central (69 percent). Other neighborhoods with above average participation were Hyde Park, the South End, Mattapan, Allston-Brighton, and Charlestown. Twelve of the sixteen

neighborhoods had higher participation rates in 1980 than in 1970, with the largest increases in Central, Mattapan, and South End. Participation rates declined in East Boston, South Boston, Roxbury, and Roslindale.

Boston's unemployment rate in April 1980, when the Census was conducted, stood at 6.1 percent. This rate was about 75 percent greater than the 3.5 percent unemployment rate registered in the 1970 Census, reflecting the generally higher U.S. unemployment rates left over after the 1974-1975 recession. In addition, unemployment rates were higher for all but two of Boston neighborhoods in 1980 than in 1970; the only exceptions were the South End and Fenway-Kenmore. Roxbury and Mattapan had the highest unemployment rates at 10.1 and 8.7 percent, respectively. The greatest rise in unemployment rates over the decade occurred in Jamaica Plain, Roxbury, North Dorchester, South Dorchester, Mattapan and Hyde Park. Lowest unemployment rates were registered in Back Bay and West Roxbury at 3.6 percent and 3.9 percent, respectively.

Tables 58 through 61 show that selected racial and hispanic groups had somewhat different participation rates. Asians and Pacific Islanders ranked the highest with 63.8 percent of those 16 and over in the labor force. White participation was slightly above average at 60.5 percent. Black participation was slightly below average at 59.1 percent across the City. Hispanic participation lagged behind the other groups with 53.6 percent of adults in the labor force, perhaps due to lower participation by women.

Unemployment rates for racial and hispanic groups also showed considerable differences citywide and among neighborhoods. Rates for racial groups citywide from lowest to highest in 1980 were: 5.1 percent for Asians, 5.2 percent for whites, 9.2 percent for blacks, and 9.9 percent for hispanics. For the three neighborhoods with the largest Asian population, (Central (Chinatown),

Allston-Brighton and the South End), Central had the highest unemployment rate. The neighborhoods with greatest white unemployment (over 6 percent) were East Boston, Charlestown, Roxbury, and South Boston. For blacks, unemployment was significantly higher (over 10 percent) in Roxbury, Dorchester, and Mattapan. Unemployment for hispanics was over 11 percent in Jamaica Plain, Roxbury, and Dorchester.

Participation rates for racial and hispanic groups varied considerably by neighborhoods. A number of factors affected participation rates. The age structure was important. Areas with sizable concentrations of young adults 25-44 years, the ages of highest labor force participation, tended to have higher participation rates. Areas with large proportions of retirees or college students tended to have lower rates of participation. Other characteristics such as education, marital status and household type, explained many of the differences. The latter were especially important in the participation of women.³

Table 62 shows neighborhood differences in the number of workers in family households. About half of Boston's families contained two workers in 1980. This is indicative of the high labor force participation of women, although the

³ The labor force is comprised of all adults (16+ years old) who are either employed (full time or part time) or "officially" unemployed (out of work and looking for work in the previous four weeks). All other individuals are not in the labor force, that is not classified as either employed or unemployed. This group includes students, the retired, homemakers, the disabled, discouraged workers not looking for work and the voluntarily idle. The labor force participation rate is the ratio of people in the labor force as a percent of total adult population. As such, the labor force participation rate is a measure of the magnitude of the adult workforce. Traditionally, labor force participation rates are higher in the New England region than for the nation as a whole because there are more women participating.

sex of neither worker is known. It represents the overall higher participation rates engendered by increased education, smaller families, and the need for a second income to make ends meet. In Back Bay-Beacon Hill, 63 percent of families had two workers. This is not surprising given the large number of young adult couples with high socio-economic status who reside there. Hyde Park, West Roxbury, Allston-Brighton, South End, Central and Roslindale were notably above average. Roxbury had the lowest proportion of two-earner families, probably because of the high proportion of single parent families, seen in Table 32. Yet a similarly high proportion of single parent families in Mattapan did not act as a deterrent.

Between a quarter and a third of the families in all the neighborhoods had a single wage earner, averaging out to 32 percent for Boston as a whole. Some 19 percent of Boston families contain no workers. While some proportion of these were the families of retirees, 19 percent was far above the statewide Massachusetts share (12 percent) of families without wage earners. Of Boston's neighborhoods, only Back Bay-Beacon Hill and Hyde Park were not significantly above the state-wide average. On the other hand, over one-quarter of Fenway-Kenmore and Roxbury families were without a wage earner. While Fenway-Kenmore may have had a significant number of student families, Roxbury and the other neighborhoods with a high proportion of workerless families, including Jamaica Plain (24 percent), South Boston (22 percent) and East Boston (20 percent), did not. Workerless families showed one way in which the economic slowdown of the mid- and late-1970s impacted families in 1980, especially minority families, as was seen in low labor force participation rates and higher than average unemployment rates for these neighborhoods. Workerless families were also higher in areas, such as South Boston and East Boston where a high proportion of the population was of retirement age and a substantial

proportion of families counted transfer payments and Social Security as their largest source of income.⁴

Industry

The number of employed Boston residents declined by only 4 percent from 266,505 in 1970 to 256,097 workers in 1980. However, Tables 63, 65 and 67, show that employment by industry changed considerably during this period. The proportion of workers employed in construction, manufacturing, communications, and wholesale and retail trade declined. Employment gains were registered in finance, insurance and real estate; business and repair services; professional and health services; educational services; and public administration. The largest gain, some 30 percent, occurred in employment in education, followed by a 20 percent gain in related professional, and health services. The net result was that in 1980, 46 percent of Boston's workers were employed in finance, business, health, education and professional services industries of all kinds compared to 38 percent in 1970.

In general, neighborhood proportions employed in the various industries followed the city-wide average. The one exception was in wholesale and retail trade where gains were registered for Central and Fenway-Kenmore residents, coupled with sharp drops for Roxbury and Mattapan. This reflected, in part, the changing character of trade in the city away from small neighborhood establishments and in part the hard times of the 1970's which closed doors to entry level jobs in trade.

⁴ Margaret C. O'Brien, "Boston and Its Neighborhoods", Research Department, Boston Redevelopment Authority, May 1982, Table II-14.

Participation in finance, business, health, educational and other professional services has increased rapidly for all the neighborhoods. Job growth has occurred in these sectors and probably will continue in the decade ahead. As of 1980, 60 percent of Back Bay-Beacon Hill residents were employed in these sectors. In Fenway-Kenmore, Allston-Brighton, and Jamaica Plain over 50 percent of residents worked in these sectors. Lagging behind the city-wide average were East Boston and South Boston at 31 percent. Hyde Park and North Dorchester also had less than 40 percent of their workers employed in these sectors. This may indicate prevailing skills, opportunities and attitudes that will carry over into or change in the future.

Occupation

During the Seventies a shift occurring within the occupational structure paralleled that in the industrial structure. The number of workers in professional, technical and managerial occupations grew by 30 percent from some 60,000 in 1970 to 78,000 in 1980. This group accounted for over 30 percent of Boston's employed workers at the decade's end. Sales and service workers grew also to 7.3 percent and 18.4 percent of Boston's workers, respectively. However, the numbers and percentages of workers in all other categories declined, including administrative support, craftsmen and foremen, operatives, transportation operatives and laborers. Clerical employees declined from 27 percent to 23 percent of the employed labor force, while employees in the remaining occupations fell from 28 percent to 21 percent of the total. These trends, documented in Tables 68 through 71, indicate that the employment trend of several decades toward professional and services occupations, and away from manufacturing and transportation, has continued. While the manufacturing job base of Boston has been eroding for some time, white collar occupations have boomed. There is some speculation that outmigrants during the 1970s may have

included disproportionate numbers of blue collar workers and their families. Others may have retired or changed occupations. An additional factor is a labor force that is now 48 percent female, up from 46 percent in 1970.

Generally, the changes in occupational distribution in the neighborhoods have paralleled those of the city as a whole. However, a number of neighborhoods have undergone unique or noteworthy changes. For instance, 57 percent of Back Bay-Beacon Hill workers had professional, technical, or managerial occupations by 1980. Over one-third of Central, South End, Fenway-Kenmore, Allston-Brighton, and West Roxbury's employed were in this category as well. The most noteworthy increases in the proportion of professional, etc., workers occurred over the decade in Central (25 to 44 percent), Charlestown (12 to 26 percent), and Roxbury (14 to 20 percent). While the gentrification of Central and Charlestown has been well documented, there has been a significant growth in professionals and administrative support personnel in Roxbury, despite Roxbury's lower than average proportion in this group.

As the professional, technical, and managerial occupations have captured larger share of Boston's resident work force, other occupational groups have declined in importance. The most notable examples were in Central and South End where losses of craftsmen, operatives, transportation operatives, laborer and even service workers, contrary to the city-wide trend, have far exceeded Boston averages. For Back Bay-Beacon Hill and Fenway-Kenmore residents, clerical occupations declined dramatically in importance. The shares of craftsmen, operatives and laborers have declined sharply in Charlestown and West Roxbury. While a severe proportional loss in operatives occurred in Roxbury, both Roxbury and Mattapan showed a rapid gain in services workers. For the other neighborhoods occupational change has been more gradual.

Full-Time and Part-Time Employment

Tables 72 through 80 give data on the work history of Boston resident workers during 1979. Because these numbers refer to the work experience during an entire year rather than one week, as the data for 1980 do, the number of workers and unemployed are larger than those for 1980.

Tables 72 and 73 show statistics on full-time and part-time workers by number of weeks worked and average number of hours worked per week. Of the 300,779 workers in 1979, some 49 percent worked 35 or more hours during 50-52 weeks of the year. An additional 9 percent worked full-time during 40-49 weeks. The sum of these two numbers, some 58 percent, might be considered full-time workers, since many have longer vacations and/or shorter work years, such as teachers.

The proportion of full-time workers is lower than one might expect. For instance, 49 percent worked 35 hours for 50 weeks, compared to the statewide proportion of 53 percent. Therefore, it seems important to know why Boston workers are less likely to work full-time. Since females were less likely to work full-time and they made up a larger fraction of Boston's workers (47.8 percent) than of Massachusetts' workers (45.5 percent), it might be surmised that they contributed to a lower proportion of 35 hour/50 week workers in the City. However, this is not the case because Boston's female workers were more likely to work full-time (43.3 percent) than were female workers resident throughout Massachusetts (40.1 percent). Therefore, Boston part-time female workers contributed a smaller proportion of part-time to all workers (27.1 percent) than was true statewide (27.3 percent).

Therefore, the excess of part-time workers in the City was due to males, some 54.3 percent of whom worked full-time compared to 63.8 percent of males statewide. While it is impossible to state with precision the contribution of various factors to higher part-time employment for males, Census data enable

the identification of both important and unimportant factors. Elderly part-time workers do not appear to contribute to the differences in that a smaller percentage of males over 65 years in Boston work than is the case throughout Massachusetts. The major contributors are a higher proportion of college students, who might hold part-time jobs year round or in the summer months, and higher unemployment among Boston males than among all Massachusetts male workers. Twenty-one percent of Boston's males were unemployed for part of 1979 versus 15.8 percent of those in Massachusetts. Additionally, the largest differences in unemployment experience between city and state in 1979 were for hispanic males (23.4 percent versus 15.8 percent) and for whites (19.7 percent versus 15.5 percent), with whites and hispanics being partially overlapping groups. These differences in unemployment during 1979 were smaller for blacks, American Indians, and Asian and Pacific Islanders.

Analysis of full-time and part-time workers by neighborhoods corroborates these suppositions about the reasons for higher part-time employment in Boston. Workers resident in Fenway-Kenmore are least likely to work 35 hours/50 weeks a year. In 1979, 20.8 percent of males, 17.7 percent of females, and an average of 19.3 percent of both sexes worked full-time. Other areas with lower than average proportions of full-time employees included Allston-Brighton (40.2 percent), Back Bay-Beacon Hill (48.5 percent), and Jamaica Plain (46.2 percent). The first two neighborhoods have sizable concentrations of students while Jamaica Plain contains a large number of hispanic persons. In the remaining neighborhoods, the proportion of full-time workers approaches or surpasses that for Massachusetts, indicating that lower full-time employment is largely limited to certain areas of Boston and to certain sectors of the population.

When neighborhood participation by sex is examined, Roxbury and South End might be included with lower full-time worker areas due to the negative impact

of unemployment on black males. Aside from very low full-time employment among Fenway-Kenmore and Allston-Brighton females, the proportion of female workers who are employed full-time varies among neighborhoods.

Place of Work

Three-fourths of Boston resident workers who reported their place of work in 1980 were employed within the City while one-fourth worked outside. The proportions varied widely among the neighborhoods, with over 80 percent of South Boston and Roxbury workers employed in Boston but only two-thirds of West Roxbury and Hyde Park workers. Accounting for these differences in Table 81 is difficult in that there is no clear relationship to education, occupation, industry, or unemployment. The most important factor appears to be location along Boston's border which makes work places outside of Boston very close for the workers of Allston-Brighton, West Roxbury, Hyde Park, and Charlestown.

Tables 82 and 83 indicate that nearly 30,000 workers or some 11.8 percent failed to report place of work. The neighborhoods with high proportions of workers not reporting place of work were Mattapan (20.6 percent), Central (19.8 percent), Roxbury (17.2 percent), South End (14.5 percent), Charlestown (14.3 percent), and North Dorchester (14.3 percent). Although most of these neighborhoods contain high numbers of minorities and new immigrants, this is not a single strong reason why place of work should not have been reported. One suspects that the factors of unemployment, part-time employment, multiple job sites (construction, repair services, etc.) or job changes have made this question more difficult to answer, despite Census instructions addressing these issues. In addition, some people may have been concerned with invasion of privacy.

In any case, those not reporting their workplace did not change the distribution of reported workplace by much. A clear majority of Boston workers

worked in Boston with a significant minority working in suburban towns. Only very small proportions work outside of the Boston metropolitan area or outside of Massachusetts. It is unlikely that the workplaces of those not reporting would have altered this distribution significantly.

Travel Time to Work

The commuting time of Boston resident workers varied considerably. One-quarter of workers spent less than 15 minutes going to work, while one-third commuted for 15 to 30 minutes, another quarter for 30 to 45 minutes and the remainder for 45 minutes or longer.

There was also considerable variation in travel time to work among neighborhoods shown in Tables 84 and 85. Workers living in Central and Fenway-Kenmore had the shortest average commute, with 40 percent of workers spending less than 15 minutes traveling to work. Workers in Allston-Brighton and the southern neighborhoods tended to have the longest commutes. In Roxbury, South Dorchester, Mattapan, and Hyde Park, over 50 percent of workers traveled one-half hour or more. In addition, 15 percent of workers from Mattapan and 11 percent of workers in Hyde Park spent one hour or longer going to work.

Differences in travel times to work were related to a number of factors. Location of work outside the city was one reason. Certain occupational skills of workers, such as manufacturing, might have been in greater demand outside Boston. Also, means of transportation to work, seen in Tables 86 and 87, was important. Neighborhoods, with a high proportion of walkers, such as Back Bay, Central, and Fenway-Kenmore, tended to have short commuting times. Heavy use of public transportation probably lengthened the commute for Roxbury residents while reliance on automobiles was related to lengthy commutes in other neighborhoods.

Transportation to Work

Boston is a unique city in that more residents traveled to work on public transportation in 1980 than drove alone in their car. Public transportation moved some 84,000, or 34 percent of resident workers. Thirty-three percent traveled alone in a car, while another 14 percent carpooled. An additional 17 percent walked to work.

The predominant means of transportation to work varied by neighborhood. One-third or more of workers in most neighborhoods took public transportation. The exceptions were Back Bay-Beacon Hill and Central areas near downtown and the suburban-like areas of Roslindale, West Roxbury and Hyde Park. In Back Bay-Beacon Hill, Central, and Fenway-Kenmore, over 40 percent of workers walked to work nearby. Driving to work either alone or in a carpool predominated in a number of areas. Over 70 percent of West Roxbury and Hyde Park resident workers drove or were driven to work. The proportions approximated 60 percent in Mattapan and Roslindale, and some 50 percent in South Dorchester, East Boston, Jamaica Plain and Allston-Brighton. The high proportions of drivers and passengers in these areas reflected the distances they travel to work, work locations, and the quality of public transportation service in these neighborhoods.

IV. Income

Income

Income may be measured for several different units of analysis: household, family, unrelated individual, and per capita. "Family income" includes income earned by all family members. "Unrelated individual income" refers to the income earned by each unrelated individual living in households or non-institutional group quarters. "Household income" refers to total income of all members of each household taken together, whether or not they are related. Each of these measures of income is useful for different purposes. Household income is the most encompassing measure for the whole population and is usually used to get a broader picture of income trends. Information is presented here for each of these three measures of income in 1980 with comparisons to 1970 data where possible. The Census income data refer to income reported for the year before the Census, i.e., 1979 and 1969.

Household Income

Tables 88 and 89 show the income of Boston's 219,024 households for 1979. The citywide median household income was \$12,530, two-thirds of the Boston SMSA household median of \$18,694. Of all the neighborhoods, only West Roxbury, at \$18,645, approximated the SMSA median. Hyde Park with \$17,030, Back Bay-Beacon Hill with \$16,042, Roslindale with \$15,116, and Central with \$14,906 were close behind. Fenway-Kenmore and Roxbury had the lowest median household incomes, at \$8,362 and \$9,392, respectively.

Table 89 also shows the household income distribution of Boston and its neighborhoods. For the city as a whole, 20 percent of households had incomes under \$5,000, another 20 percent had incomes between \$5,000 and \$10,000, some 30 percent had incomes between \$10,000 and \$20,000, while the remaining 30

percent had incomes of \$20,000 or more. The table indicates that in all Boston neighborhoods, over 10 percent of the households had less than \$5,000 in income. Nevertheless, the proportion of households with income less than \$5,000 ranged from nearly one-third in Fenway-Kenmore, and one-quarter in East Boston, South Boston, Roxbury, and South End, to just over 10 percent in West Roxbury and Hyde Park. Similarly, in the \$5,000-\$10,000 range, West Roxbury and Hyde Park had lower proportions, some 15 percent, while Roxbury and Fenway-Kenmore had higher proportions, 25 percent or more.

While there was not much variation among neighborhoods in the proportions of households in the middle income groups of \$10,000-\$20,000, differences between neighborhoods again emerged in the upper income groups. The differences show that, as might be expected, Hyde Park, West Roxbury and Roslindale had over 30 percent of their households in the \$20,000-\$40,000 income group. For Fenway-Kenmore and Roxbury, the proportions were low, at 11.5 percent and 14.3 percent, respectively. In the income range above \$40,000, Back Bay-Beacon Hill, Central and West Roxbury had the highest proportions of households. What distinguished high median income neighborhoods from the others is either a more substantial proportion of households in the middle income range of \$20,000-49,999, as seen for suburbanlike neighborhoods in the southern part of Boston, or a relatively high proportion of households in the \$40,000 or more income category, as seen for Central and Back Bay-Beacon Hill.

A comparison of the high and low ends of the income spectrum in Table 89, reveals that nearly one-third of Fenway-Kenmore households had incomes of less than \$5,000, reflecting a large student population. About one-quarter of South Boston, Roxbury, East Boston and South End households fell in this lowest income group as well. In these neighborhoods, lower labor force participation,

lower educational attainment, lesser paying occupations, and longer term unemployment than Boston averages are important factors. On the other hand, nearly 10 percent of households in Back Bay-Beacon Hill and 7 percent of those in Central earned \$50,000 or more. This is due to higher levels of educational attainment, occupational skills and two-worker families in these neighborhoods.

Income of Unrelated Individuals

Unrelated individual incomes are generally lower than those of families and households. In 1979, the median income of unrelated individuals was \$5,877, less than half of the \$12,530 household median. The range was from \$2,848 for Fenway-Kenmore to \$9,872 in Central, seen in Table 90. The very low figure for Fenway-Kenmore reflects both the high proportion of part-time employment mentioned earlier, which is largely attributable to students, and the inclusion of students living in dormitories among unrelated individuals. Table 91 shows that 70 percent of Fenway-Kenmore unrelated individuals had incomes of less than \$5,000. On the other hand, gentrification has brought sizeable proportions of unrelated individuals with incomes of \$25,000 or more to some neighborhoods. The proportions are 12 percent in Back Bay-Beacon Hill, 10 percent in Central, and 6 percent in South End.

Despite the very low figures for Fenway-Kenmore, unrelated individual income for Boston rose sharply over the 1970-1980 decade, more than doubling from the 1969 median of \$2,818. Yet it declined from 94 percent of the Boston SMSA unrelated individual median in 1969 to 82 percent (\$7,198) in 1979.

Family Income

Median family income increased by 76 percent in Boston between 1969 and 1979 from \$9,133 to \$16,062. However, Boston SMSA median family income doubled during the same period to \$22,848. Table 92 shows that the sharpest rises in family incomes occurred in Back Bay-Beacon Hill and the South End with 125 percent and 138 percent gains respectively. Families in Central lagged behind the rest of Boston's families with a 44 percent gain on average. Families in Central did not share in the income upgrading evident among unrelated individuals in that neighborhood. Jamaica Plain, Roxbury, East Boston, Mattapan and South Dorchester also had lower gains in median family income than the Boston average.

Tables 93 and 94, which show the income distribution of families, indicate that Back Bay-Beacon Hill had by far the highest median family income, \$32,686. This was due to small proportions of families in the low income groups and high proportions in the middle and upper income categories, capped with 31 percent of families earning \$50,000 or more. Many of these high income families were young professional couples with two wage earners. Central showed somewhat the same distribution but to a much lesser extent. The other neighborhoods with incomes notably above the average were West Roxbury, Hyde Park, and Roslindale which had higher proportions of families in the \$15,000 to \$40,000 range.

Among neighborhoods with low median family income in 1979, Roxbury had the lowest, \$10,773. Other neighborhoods with median family incomes under \$15,000 included Fenway-Kenmore, Jamaica Plain, East Boston, South End, Mattapan, and North Dorchester. In these areas, one-third or more of the families had incomes of less than \$10,000, with Roxbury having 47 percent of its families in this group. Many of these areas were characterized by high or growing proportions of minority families. Fenway-Kenmore also housed many young people just starting out whose incomes were low. East Boston had a high proportion of

low income elderly. The unemployment levels, occupational structure, and family composition cited earlier for these planning districts and for minority groups were important contributors to low income levels.

Comparison with the 1969 family income distribution by neighborhoods in Tables 95 and 96 is somewhat difficult. Nevertheless, families resident in Back Bay-Beacon Hill and South End in 1980 were better off on average than families living there in 1970, largely due to gentrification. The income distributions of families in other neighborhoods have remained relatively the same with some gains in North Dorchester and the three suburbanlike areas of Roslindale, West Roxbury and Hyde Park, when compared with all neighborhoods. Family income in Jamaica Plain has eroded, as has that of families in Central City except in the highest income groups. The replacement of settled, working class families by non-English speaking immigrants may have contributed to these declines.

Family Income by Race and Spanish Origin

Tables 97 to 104 present information on the distribution of family income of whites, blacks, Asian and Pacific Islanders, and householders of Spanish origin for the city and by neighborhood. Citywide, the differences in income among those groups were significant. Whites have an above average median family income of \$18,308, while other groups lagged behind the Boston median \$16,062. For blacks, the median family income was \$11,462. The median for Asian and Pacific Islander families was \$14,194, while that for hispanic families was only \$9,027. As expected from these medians, higher proportions of white and Asian families had incomes in the middle- and upper-income categories. For black and hispanic families, higher proportions fell in the lower income categories. Indeed, 21 percent of black families and 28 percent of hispanic families reported incomes of less than \$5,000.

This overall disparity in the income distributions of racial and hispanic groups was maintained throughout the neighborhoods with several exceptions. Incomes for black families were lower than expected in East Boston, South End and Roslindale, but higher than expected in West Roxbury. Asian family incomes were relatively low in Central, Back Bay-Beacon Hill, and Mattapan, but relatively high in Charlestown and Fenway-Kenmore. Incomes of hispanic families were especially lower in Roxbury, South End, South Boston, and Mattapan, but higher in Charlestown, Back Bay-Beacon Hill, Roslindale, West Roxbury, and Hyde Park. The incomes of white families were lowest in Roxbury and Fenway-Kenmore. It should be noted that because of small groups of minority population in some neighborhoods the income data may have been partially suppressed. Therefore, these income statistics should be used with some caution.

Poverty

Poverty status is determined for families, unrelated individuals, and persons according to whether or not incomes for 1979 fell below poverty thresholds calculated on the basis of the number and ages of household/family members. Tables 105 and 106 show that Boston had mixed reviews with regard to poverty. The proportion of families in poverty increased from 11.3 percent in 1969 to 16.7 percent in 1979. However, the proportion of unrelated individuals in poverty declined from 30.7 percent to 26.5 percent in 1979.

At the neighborhood level, above average proportions of families in poverty in 1979 were closely related to low family incomes and to a high proportion of female headed households with children examined earlier. Neighborhoods where all three indicators were high included Roxbury, North Dorchester, Jamaica Plain, South End, and Mattapan. In addition, South Boston had above average incidence of family poverty and of female-headed families

with children. The highest proportion of families in poverty was found in Roxbury (30 percent), North Dorchester (24 percent), and Jamaica Plain (22 percent). As expected from family income statistics, West Roxbury, Back Bay-Beacon Hill, and Hyde Park had the lowest proportions of families in poverty.

The highest proportions of unrelated individuals in poverty were found in Fenway-Kenmore (41 percent) and Allston-Brighton (32 percent), reflecting large student population living in and outside of dormitories. Other neighborhoods with high proportions of unrelated individuals in poverty were Roxbury, with 35 percent, and Jamaica Plain, North and South Dorchester and Mattapan, with 25 percent.

Tables 107 to 109 provide information on the proportion of persons in various groups whose family or individual incomes fell below the poverty threshold. In 1979, 20 percent of Boston residents lived in poverty, an increase from 16 percent in 1969. While a lack of comparative statistics for 1969 prevent analysis of which groups have experienced increases in poverty levels, Tables 107 and 109 indicate poverty levels for total, white, black, and hispanic populations in 1979.

In two neighborhoods significantly higher proportions of residents were in poverty than the citywide average: Fenway-Kenmore (35 percent) and Roxbury (30 percent). Other areas above the Boston average included Mattapan, Jamaica Plain, South End, Allston-Brighton, and North Dorchester. Again, students and minorities made up a high proportion of the residents of these areas. West Roxbury and Hyde Park had extremely low proportions living in poverty.

A smaller proportion, some 16 percent, of white residents had incomes below the poverty level in 1980. The high proportions among whites in Fenway-Kenmore (35 percent) and Allston-Brighton (22 percent) reflect large

student populations, while those in South Boston and Roxbury (24 percent each) indicate more systemic poverty.

Twenty-nine percent of Boston's black population was in poverty, a considerably higher proportion than the Boston average and slightly higher than the 1969 proportion of 28 percent. The proportions hovered close to 40 percent in East Boston, Fenway-Kenmore, and Roslindale, and close to one-third in Jamaica Plain and North Dorchester. Significantly lower proportions were found in West Roxbury and Hyde Park.

Poverty has been pervasive among Boston's hispanic population. Forty-two percent lived in poverty in 1979, compared to 34 percent in 1969. The proportions of persons in poverty were highest in planning districts with large concentrations of hispanics: Roxbury (52 percent), North Dorchester (50 percent), South Dorchester (46 percent), and Jamaica Plain (42 percent). However, since poverty status was determined for only 65 percent of Boston's hispanics, these numbers should be used with caution.

Table 109 indicates the extent of poverty among the elderly. Some 13 percent of Boston's elderly have incomes below the poverty level, compared to 15 percent in 1969. Planning districts with unusually high proportions of elderly in poverty included South End (24 percent), Central (20 percent), Roxbury (19 percent), and South Boston (17 percent). However, in most neighborhoods the extent of poverty among the elderly was lower than that among the population of all ages, probably because of indexed Social Security. Indeed, poverty is increasingly found among minorities and families rather than among the elderly.

Type of Income

Tables 110 and 111 indicate the number and proportion of households in planning districts that receive income of various types. Many households have

several kinds of income, for instance, earnings and Social Security. While the tables do not identify how many households have specific combinations of types of income, they do indicate the relative dependence of households on various sources of income in 1980.

Three-fourths of Boston households had earnings from wages, salaries, or self employment. Over one-third had income from interest, dividends, and rents. About one-quarter received Social Security income. Some 15 percent received public assistance, and 20 percent had income from other sources.

There was considerable variability in the sources of household income by planning district. Over 80 percent of Central, Back Bay-Beacon Hill and Hyde Park households had earnings income. The proportion fell to about two-thirds for East Boston, South Boston and South End. Two-thirds or more of households in East Boston, South Boston, Roslindale and West Roxbury, planning districts with high proportions of elderly, had income from Social Security. Thirty-five percent of Roxbury households received income from public assistance; Mattapan, North Dorchester and South Dorchester were also well above the Boston average. This is probably related to the higher proportions of single mothers in these areas. In general, median household income was higher for a neighborhood with a higher proportion of households receiving interest, dividend and rental income and lower proportions receiving Social Security and public assistance.

V. Housing

Housing

The total number of housing units in Boston increased by about 4 percent between 1970 and 1980. Large increases occurred in Charlestown, Central, Back Bay-Beacon Hill, South End, Allston-Brighton, and West Roxbury. These planning districts have experienced general upgrading as residential areas, indicated by new construction, conversion of apartments to condominiums, and conversion of nonresidential structures into housing. Table 112 reflects the net change in each neighborhood resulting from both these additions to the housing stock and losses from demolitions and conversions of residential properties to non-residential use. Mattapan, Roxbury, South Dorchester, and Fenway-Kenmore had the largest losses in housing units.

Number of Housing Units in Structure

Underlying this increase to 241,343 housing units in 1980 from 232,407 in 1970 were increases in the number of single-family homes and structures with 5 or more units. The number of housing units in 2 to 4 unit structures declined during the decade, as seen by comparing Tables 113 and 115.

Single family homes increased by almost 10 percent to 37,746 in 1980. The largest increases occurred in West Roxbury, Allston-Brighton, Hyde Park, Mattapan, South Dorchester and Roxbury. The number of single dwellings increased by 35 percent in Allston-Brighton, 22 percent in Mattapan, 18 percent in Roxbury and 17 percent in West Roxbury. In 1980, the largest number of single family dwellings were in West Roxbury, Hyde Park, South Dorchester and Roslindale, which together contained 54 percent of the single housing units.

While Boston as a whole lost 5 percent of its housing units in two-unit structures, the pattern was uneven through the neighborhoods. Several

neighborhoods gained housing in two-unit structures. South End and Beacon Hill more than doubled their small numbers of this type of housing while Charlestown, East Boston and Central had small increases. This trend was most likely due to rehabilitation and conversion of older structures. The decline in the number of residences in two-unit structures prevailed in the other neighborhoods, with substantial losses in South Dorchester, Mattapan, Hyde Park, Roslindale, West Roxbury and South Boston.

The pattern of loss of housing units in 3-4 unit structures was also uneven. Boston lost 7 percent of its units in this housing type. Heavy loss occurred in Mattapan, (23 percent) Roxbury, (14 percent) South Dorchester, (11 percent), Jamaica Plain (11 percent) and North Dorchester (10 percent). On the other hand, Back Bay and South End gained housing in 3-4 unit structures. Nonetheless, the overall loss in Boston indicates the decline of a historically important source of housing in the city.

The gain in housing in buildings with 5 or more units was pervasive throughout the neighborhoods. Only Mattapan and Hyde Park lost rather than gained dwellings in larger structures. Central and Allston-Brighton gained more than 3,500 units in this category, while Roxbury, West Roxbury and Fenway-Kenmore gained 1,000 units or more. The number of units in larger structures increased by nearly two-thirds in Central and West Roxbury, by over one-third in East Boston, and by nearly one-quarter in Allston-Brighton, Charlestown and Roslindale.

In 1980, 43 percent of Boston's housing units were in structures with 5 or more units. Some 27 percent were in 3-4 unit buildings, and 15 percent were single and duplex buildings. Therefore, units in larger buildings were the largest source of housing in the city.

Buildings with 5 or more housing units were the predominant housing source in a number of neighborhoods. They yielded 93 percent of the housing in

Fenway-Kenmore, 85 percent in Back Bay-Beacon Hill, 77 percent in Central and 62 percent in Allston-Brighton. For other neighborhoods, much of the housing was in buildings with 3-4 units and 5 units or more. These neighborhoods included South Boston, South End, Jamaica Plain, Roxbury and North Dorchester. In East Boston, 3-4-unit structures predominated. Single-family homes were dominant in West Roxbury and Hyde Park. The remaining neighborhoods of Charlestown, South Dorchester, Mattapan and Roslindale, had a mixture of housing types.

Vacancy Rates and Households

The number of households, i.e., occupied housing units, remained stable in the City of Boston with 217,622 in 1980 compared to 217,457 in 1970. Table 116 indicates that net increases in households were highest in South End (34 percent), Allston-Brighton (28 percent) and Central (23 percent). Sizeable increases in the number of households also took place in Back Bay-Beacon Hill (14 percent), West Roxbury (10 percent), and Charlestown (9 percent). On the other hand, the number of households declined by over 15 percent in Mattapan and North Dorchester and by close to 10 percent in South Dorchester, Roxbury, and Jamaica Plain.

These changes in numbers of households were due to two factors, seen in Tables 117, 118, and 119. The first was the change in the number of housing units. The second was the vacancy rates for these housing units. Among those planning districts with substantial increases in households, all had substantial increases in housing units and only Charlestown had a substantial increase in vacancies. Among planning districts with noteworthy losses in households, all except Jamaica Plain had lost units and increased their vacancies from 1970.

In 1970, the vacancy rate for Boston stood at 6.4 percent. The planning districts with the highest vacancy rates were South End (16 percent), Roxbury (12 percent) and Central (10 percent). By 1980, vacancy rates had risen to 10 percent or higher in a majority of Boston's planning districts. These neighborhoods included North Dorchester, Jamaica Plain, Charlestown, Roxbury, South End, Mattapan, East Boston, and South Boston. They all exceeded the city-wide vacancy rate of 9.5 percent.

In 1980, the U.S. Census Bureau provided more detailed information about vacancies than had been available in 1970. Table 117 shows all vacant units and the two components of this measure, vacant units not boarded-up and boarded-up units, for each planning district. Adjustment of the vacancy rate to exclude boarded-up units lowers vacancies to 7.5 percent of Boston's housing stock. The sharpest decreases in vacancy rates occurred in planning districts where there were large blocks of boarded-up public housing units such as North Dorchester, Charlestown, Roxbury and Jamaica Plain. In these planning districts, boarded-up units, comprise 52 percent, 52 percent, 28 percent, and 25 percent, respectively of all vacancies. This loss due to boarded-up units is now being addressed by the Boston Housing Authority, Boston Redevelopment Authority, and U.S. Department of Housing and Urban Development.

Tables 120 and 121 indicate the number and proportion of long-term and short-term vacancies. In general, in neighborhoods with high vacancy rates, the proportion of long-term vacancies was higher, and was a higher proportion of all vacancies. For instance, in North Dorchester, the vacant-for-rent units comprised 13.1 percent of the year-round housing stock, while those available for rental for two or more months were 12.4 percent of the total. Most of the vacant-for-sale units had been available for 6 months or more. And another 3.8 percent of the stock was in the "other vacant" category, much of it

probably awaiting repairs. Other neighborhoods with long-term vacancies of 5 percent or more included Charlestown, South End, Jamaica Plain and Roxbury.

Tenure

Tables 118 and 119 indicate that owners lived in some 27 percent of Boston's occupied housing units in both 1970 and 1980. Seventy-three percent of households were occupied by renters. The planning districts with the highest proportions of rental households continued to be Fenway-Kenmore, Central, South End, Allston-Brighton, and Back Bay-Beacon Hill. Those with the lowest proportions continued to be West Roxbury, Hyde Park, and Roslindale where the proportion of single-family homes was high.

Nevertheless, this stability belied change in several neighborhoods. The proportion of rental units declined in Central, Back Bay-Beacon Hill, and South End largely due to condominium conversions of units. Likewise the proportion of rental units declined in Jamaica Plain, Roxbury, North Dorchester and Mattapan. While some of this change in Jamaica Plain is due to conversions, most of the increase in the proportion of owner-occupied units in these areas was due to the loss of occupied units. Substantial increases in the proportion of rental units in West Roxbury and Allston-Brighton were attributable to increases in housing units.

Household Size

Household size, i.e., the number of persons living in an occupied housing unit, declined substantially in the 1970s, in Boston and nationwide. In 1980, Boston's mean household size was 2.40 persons, a decline from 2.76 per unit in 1970. While single person households increased substantially, those with three or more persons declined. As Tables 122 and 123 show, the larger the average household size in 1970, the larger the decline for that neighborhood between

1970 and 1980. The smallest average household sizes were found in Back Bay-Beacon Hill and Fenway-Kenmore, while the largest were in Mattapan, North and South Dorchester, Roslindale, and Hyde Park.

The median number of persons per occupied unit is even lower, 1.95 persons city-wide in 1980. This is not surprising given that 37 percent of Boston's households contained only one person in 1980, as seen in the section about Household Composition. This is an increase from 29 percent in 1970.

Median Value of Owner-Occupied Non-Condominium Units

Table 124 shows the median value of owner-occupied non-condominium units declined by 5 percent when measured in constant 1980 dollars. The value was \$36,089 in 1980 compared to an estimated \$38,133 in 1970, adjusted for inflation. North Dorchester, South Dorchester, Mattapan and Hyde Park had larger than average declines in owner-occupied housing values. On the other hand, inflation adjusted housing values leapt upward in South End (74 percent), Fenway-Kenmore (58 percent) and Charlestown (53 percent) where gentrification was taking place. Substantial but less dramatic increases in owner-occupied housing values also occurred in South Boston and Central (20 percent). Smaller increases in real value occurred in other planning districts.

Median Contract Rent

Between 1970 and 1980, median contract rent in Boston was essentially stable, rising by only one-half a percent from \$191 to \$192. Table 125 shows comparative figures adjusted for inflation to constant 1980 dollars for Boston's planning districts. Large increases in contract rents (about 28 percent) occurred in South End and Central, with smaller increases occurring in Charlestown (12 percent) and Fenway-Kenmore (2 percent).

Rents were stable or declined in other Boston neighborhoods. In areas like Back Bay-Beacon Hill and Allston-Brighton, small declines may have resulted from the removal of rental units for condominium conversion.

Contract Rent

The distribution of contract rents for neighborhoods, shown in Tables 126 and 127, provides more complete information than the medians do. The largest proportions of rental units with contract rents of less than \$100 were found in South Boston, Charlestown, East Boston, Roxbury and South End. The proportions ranged from 33 to 22 percent. Close behind were Jamaica Plain and North Dorchester. In addition, another 57 percent of North Dorchester units rented for between \$100 and \$159.

Areas with high contract rents included Central and Back Bay-Beacon Hill where 27 and 21 percent of units, respectively, rented for \$400 or more per month. In addition, about two-thirds of the units in Back Bay-Beacon Hill, West Roxbury and Allston-Brighton commanded a contract rent of \$200-\$400 per month as did over half of Fenway-Kenmore apartments.

Race and Hispanic Origin of Households

Some 74 percent of Boston households were headed by white persons, and another 20 percent by blacks. Other racial groups occupied the remaining 6 percent of city households. Additionally, Table 128 shows that 5 percent of Boston households were headed by hispanics. Whites predominated in all areas except Roxbury and Mattapan where blacks constituted 80 percent of householders. Blacks also made up 24 percent of the householders in South Dorchester and 18 percent of those in Jamaica Plain. Householders of other racial groups headed 10 percent or more of all households in Central, South End, Jamaica Plain, Roxbury and North Dorchester. In Central and South End,

the majority may have been Asians. In South End and the other planning districts noted, a large proportion may have been persons who wrote in "Hispanic" as a racial category. Hispanics headed 15 percent of the households in Jamaica Plain and some 10 percent of the households in Roxbury, South End and North Dorchester.

Characteristics of Housing Units by Race and Hispanic Origin of Household Head

Tenure

Black and hispanic householders tended to rent to a greater extent than did all Boston households. Tables 129 and 130 indicate the number and proportion of renters among total, black and hispanic-headed households by planning district. While 73 percent of the households citywide rented their housing, 79 percent of black, and 86 percent of hispanic households did so. The proportion of black households renting exceeded that of all households in every neighborhood except Hyde Park, where two-thirds of black households owned their homes. This was generally true for hispanic households also, with the excepted neighborhoods being Charlestown, South Boston, Central, Fenway-Kenmore and Hyde Park.

Overcrowding

Tables 131 and 132 indicate the number of occupied housing units with plumbing facilities for exclusive use of the household and the number of these units which are overcrowded. In general, 97 percent or more of households had

their own plumbing facilities. The only neighborhood to be largely different is the South End where 20 percent of households lacked separate plumbing facilities, and a large proportion of them were black households. Table 132 shows that of the 9,089 overcrowded (1.01 persons or more per room) housing units in Boston, 3,191, or 35 percent, were occupied by black households and 1,592, or 18 percent, by hispanic households. The largest enclaves of overcrowded housing were found in Roxbury, followed by South Dorchester, Allston-Brighton, South End, Jamaica Plain and Mattapan.

Table 133 indicates the proportion of households that were overcrowded. For Boston as a whole, 4 percent of the total households were overcrowded while nearly 8 percent of black and 16 percent of hispanic households were overcrowded. Black households were nearly twice as likely and hispanic households three-and-a-half times more likely to exist in overcrowded conditions as the average Boston household. Overcrowding was especially severe for hispanic households in North Dorchester (25 percent), Roxbury (21 percent), South End (20 percent), South Dorchester (17 percent) and Mattapan (17 percent). Above average overcrowding existed among black households in North Dorchester (14 percent), Jamaica Plain (10 percent), and South Dorchester (9 percent).

Gross Rent

Gross rent is often used as a comparative measure of rental housing costs. It includes contract rent and heat and utilities, if they are paid separately. Tables 134 and 135 shows the number of households in Boston and the planning districts that pay varying amounts of gross rent. Some 58,000 of the 156,899 total households paid \$200-\$299 monthly gross rent in 1980. Thirty-seven percent of households fell in this category, while 30 percent paid less than \$200 and 32 percent paid more than \$300 monthly.

The median gross rent for Boston rental households was \$254, as seen in Table 136. There was a good deal of variability in the median gross rent by planning district, from \$184 per month in South Boston to \$327 in Back Bay-Beacon Hill. Low median gross rents were also seen in Roxbury (\$194), East Boston (\$208) and Charlestown (\$215). High median gross rents also characterized West Roxbury (\$296), Allston-Brighton (\$291) and Central (\$282). The variability in gross rents reflected the income distributions of the planning districts mentioned earlier.

Tables 137 through 139 permit comparisons among white, black, and hispanic renter households. While the data are subject to some suppression by the U.S. Bureau of the Census, they are usable for comparative purposes. Citywide gross rents of white households tended to be higher than those of black and hispanic households. Median gross rents were \$264, \$219 and \$238 for the respective groups. While somewhat over one-third of householders in each group paid gross rents of \$200-\$299, a higher proportion of white households (25 percent) were able to pay \$300 or more than was true of black (22 percent) or hispanic households (25 percent). Correspondingly lower proportions of white and higher proportions of minority households paid lower gross rents. Nevertheless, the differences between gross rents of white, black and hispanic households were smaller than the differences between neighborhoods. Within each of these tables, there is great disparity with regard to gross rents by neighborhood. For instance, some 42 percent of black households living in Central paid \$300 or more in monthly gross rent. However, the corresponding proportions for South End and Roxbury were 11 and 13 percent.

VI. Residential Mobility

Five-Year Residential Mobility

U.S. Census statistics provided information about residential mobility for Boston in 1980 and 1970. One set of data provided information about where persons 5 years or older at the time of the census lived five years earlier for those who reported previous residence (Table 140). The categories of residence five years earlier were same house, different house in Suffolk County, within Massachusetts but outside Suffolk County, rest of the United States, and abroad.

These data indicated that a higher proportion of those living in Boston in 1980 had lived outside Suffolk County five years earlier than was true in 1970. While there was no change between 1970 and 1980 in the proportion living in the same dwelling five years earlier (53 percent), 24 percent had lived elsewhere in Suffolk County and 23 percent had lived outside of Suffolk County in 1975. The comparable proportions ten years earlier had been 28 percent in Suffolk County and 18 percent outside of Suffolk County. Of the last, 6 percent had lived in Massachusetts, 9 percent in the rest of the U.S., and 3 percent abroad. By 1980, 8 percent had lived elsewhere in Massachusetts, 11 percent elsewhere in the U.S., and 4 percent abroad, as seen in Table 141.

When attention was focused on planning districts in 1980, very different patterns of residence five years earlier emerged. The planning districts with the least mobile populations were East Boston, Charlestown, and South Boston and the suburban areas of Roslindale, West Roxbury, and Hyde Park. In these areas, two-thirds of residents had lived in the same dwelling five years earlier, 20-25 percent had lived elsewhere in Boston, and small percentages had moved there from outside of Boston, with a notable 8 percent of Charlestown and West Roxbury residents moving in from the suburbs. In the middle were two groupings of neighborhoods with increasing proportions from other homes in Boston and from abroad. These included Roxbury and South Dorchester, followed

by Mattapan and North Dorchester. Jamaica Plain resembled the latter but had a higher proportion of residents from Massachusetts (7 percent) and other states (10 percent). These trends, indicating the attractiveness of neighborhoods to people who were not Boston residents five years earlier, were increasingly important in the neighborhoods with more mobile residents.

Planning districts with more mobile populations in 1980, ranked from less to more mobile, included South End, Central, Allston-Brighton, Back Bay-Beacon Hill, and Fenway-Kenmore. In Fenway-Kenmore, with its large student population, only 20 percent of residents had lived in the same home in 1975, with an additional 11 percent moving in from within Boston. Of the 69 percent who had lived outside of Boston in 1975, 17 percent were from Massachusetts, 42 percent hailed from elsewhere in the U.S., and 10 percent were from abroad. Back Bay-Beacon Hill also had large proportions of residents from outside of Boston. The degree of mobility shown in these planning districts was remarkable in a state where 61 percent of those 5 years and older lived in the same house that they had occupied five years earlier and only 9 percent had come from outside Massachusetts or abroad.

Year Householder Moved Into Dwelling

Boston's high mobility compared to that of Massachusetts residents is underscored by a comparison of the householder's length of residence in his/her current dwelling, seen in Table 142. Over one-quarter of Boston householders moved into their dwellings in the year and a quarter preceding the census, and over one-half in the five years preceding. For Massachusetts, the comparable proportions were 8 percent and 28 percent. This disparity was due to the large renter population, 73 percent of households, in Boston.

Within Boston neighborhoods, there was a close relationship between the proportion of units rented and the proportion of householders who moved in

during the year before the census. Fenway-Kenmore ranked highest on both measures with over 50 percent of householders moving in recently. The young adult areas of Back Bay-Beacon Hill, Allston-Brighton, South End and Central had 30 percent or more new arrivals. Roslindale, West Roxbury, and Hyde Park contained the lowest proportion of recently moved households. Clearly, tenure and the age structure of the population were related to mobility.

VII. Prologue to the 1980s

Closing

The diversity and change that occurred among Boston's neighborhoods go hand-in-hand with nondemographic changes during the 1970s. Bussing had a negative impact in 1973-1974 and ensuing years. The mid-decade recession brought high unemployment, which peaked in 1975 and declined since then. The burden of overtaxation dampened growth in housing values. Economic development within the city brought growth in the number of high-level jobs. New public facilities were constructed to serve the neighborhoods. From 1970 to 1980 Boston lost 78,077 people, 12 percent of its 1970 population, including one-fourth of its white population, and 57,798 in the "14 and under" age group.

Yet the seeds of change, and population trend reversal, were already evident. Even while population in the City as a whole was declining between 1970 and 1980, the more centrally located neighborhoods, such as Waterfront-North End-Central Business District, Back Bay-Beacon Hill, South End and Allston-Brighton, were gaining. There was also a net growth of 32,040 in the young adult age group (aged 20 to 34). The minority population--black, hispanic, and Asian and Pacific Islander--also grew during the seventies and is expected to continue to grow.

These increases reflected both economic and demographic phenomena signalling a change in Boston's fortune. The expansion of jobs in Boston from mid-decade onward (in the 1970s) flowed from the structural transformation of the City's economy favoring those industries expanding most rapidly nationally. The influx of young adults responded to the coming-of-household-formation-age of the baby-boom youngsters and their frequent preference for city living and the amenities and improved ambience of Boston.

In addition, the factors impelling the reduction in white population and children were moving out of the picture. The long-term loss of blue collar jobs in the 1960s and 1970s had spurred the outflow of blue collar workers and

their families. By the latter years of the 1970s, however, this long-extended phase had ended and blue collar jobs had stabilized (at a fraction of their former level). In a counter flow, young adult white workers were attracted into Boston. In post-1980 reports, the United States Census Bureau reported net immigration into Boston for the first time in fifty years.

Furthermore, much of the loss of children had resulted from the steady decline in the birth rate in Boston in the past two decades, reflecting national trends in birth rates, as well as the suburbanization of recent decades. But Boston's birth rate has been rising since 1977, largely due to the baby-boom households and to the growing minority population.

As Boston enters the 1980s, the changes of the 1970s provide a prelude to the future. The factors to bring about a reversal of population loss have been evident already. In addition, the city now has gained an improved infrastructure; a fairer tax structure resulting from revaluation and classification; growth in economic opportunity which will more directly benefit Boston residents through the efforts of the Boston School Department, the Private Industry Council and others, the presence of large numbers of minorities and students in institutions of higher education, and a transformed occupational structure. These factors provide a new context within which the changes of the 1980s are taking place.

POVERTY STATUS IN 1979

Definitions

The data on poverty status were derived from answers to the same questions as the income data (see the section on "Income in 1979").

Poverty statistics presented in this report are based on a definition originated by the Social Security Administration in 1964 and subsequently modified by Federal interagency committees in 1969 and 1980. At the core of this definition is the 1961 economy food plan, the least costly of four nutritionally adequate food plans designed by the Department of Agriculture. It was determined from the Agriculture Department's 1955 survey of food consumption that families of three or more persons spend approximately one-third of their income on food; hence the poverty level for these families was set at three times the cost of the economy food plan. For smaller families and persons living alone, the cost of the economy food plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses for these smaller households.

The income cutoffs used by the Bureau of the Census to determine the poverty status of families and unrelated individuals consist of a set of 48 thresholds arranged in a two-dimensional matrix consisting of family size (from one person to nine or more persons) cross-classified by presence and number of family members under 18 years old (from no children present to eight or more children present). Unrelated individuals and two-person families are further differentiated by age of the householder (under 65 years old and 65 years old and over). The total income of each family or unrelated individual in the sample is tested against the appropriate poverty threshold to determine the poverty status of that family or unrelated individual. If the total income is less than the corresponding cutoff, the family or unrelated individual is classified as below the poverty level. The number of persons below the poverty level is the sum of the number of persons in families with incomes below the poverty level and the

number of unrelated individuals with incomes below the poverty level.

The poverty thresholds are revised annually to allow for changes in the cost of living as reflected in the Consumer Price Index. The average poverty threshold for a family of four persons was \$7,412 in 1979. (See table at end of appendix.)

Poverty thresholds are computed on a national basis only. No attempt has been made to adjust these thresholds for regional, State, or local variations in the cost of living. For a detailed discussion of the poverty definition, see U.S. Bureau of the Census, Current Population Reports, Series P-80, No. 133, *Characteristics of the Population Below the Poverty Level: 1980*.

There may be slight differences between the data in this report on poverty status in 1979 and similar data shown in the *Summary Characteristics for Governmental Units and Standard Metropolitan Statistical Areas*, PHC80-3, reports and in the Supplementary Reports, *Advance Estimates of Social, Economic, and Housing Characteristics*, PHC80-S2. Any such differences are a result of errors in the income data which were corrected after the release of the PHC80-3 and the PHC80-S2 reports.

Persons for Whom Poverty Status is Determined—Poverty status is determined for all persons except inmates of institutions, persons in military group quarters and in college dormitories, and unrelated individuals under 15 years old. When the line, "Persons for whom poverty status is determined," appears under the heading, "All Income Levels in 1979," it shows the total population minus persons in the four groups listed above. When the same line appears under the heading, "Income in 1979 Below Poverty Level," it shows the number of such persons who are classified as being below the poverty level. In tables that contain only poverty data, the above exclusions are stated in the headnote and the word "persons" is used in place of "persons for whom poverty status is determined."

Specified Poverty Levels—Because the poverty levels currently in use by the Federal Government do not meet all the needs of data users, some of the data are presented for alternate levels ranging from 75 percent to 200 percent of the

current poverty level. These specified poverty levels are obtained by multiplying the income cutoffs at the poverty level by the appropriate factor. For example, the average income cutoff for 125 percent of poverty level was \$9,265 (\$7,412 x 1.25) in 1979 for a family of four persons.

Weighted Average Thresholds at Poverty Level—The average thresholds shown in the first column of the table were weighted by the presence and number of children. For example, the weighted average threshold for a given family size is obtained by multiplying the threshold for each presence and number of children category within the given family size by the number of families in that category. These products are then aggregated across the entire range of presence and number of children categories, and the aggregate is divided by the total number of families in the group to yield the weighted average threshold for the poverty level for that family size.

Since the basic thresholds are used to determine the poverty status of families and unrelated individuals are applied to all families and unrelated individuals, the weighted average poverty threshold is derived using all families and unrelated individuals rather than just those classified as being below the poverty level. To obtain the weighted poverty thresholds for families and unrelated individuals below alternate poverty levels, the weighted thresholds shown in the table may be multiplied directly by the appropriate factor. The weighted average thresholds presented in the table are based on the March 1980 Current Population Survey. However, it is felt that the thresholds would not differ significantly from those based on the 1980 census.

Income Deficit—Income deficit is the difference between the total income of families and unrelated individuals below the poverty level and their respective poverty thresholds. In computing income deficit, families reporting an income loss are assigned zero dollars for such cases the deficit is equal to the poverty threshold. This measure provides an estimate of the amount which would be required to raise the incomes of poor families and unrelated individuals to their respective poverty thresholds. Income deficit is thus a measure of the degree of impoverishment of a family.

ated individual. However, caution be exercised in comparing the age deficits of families with different characteristics. Apparent differences in age income deficits may, to some extent, be a function of differences in family size.

Income Deficit—The mean income deficit is the amount obtained by dividing total income deficit of a group below poverty level by the number of families (or unrelated individuals) in that group.

Comparability With Earlier Census Data

The poverty definition used in the 1980 census differs slightly from the one used in the 1970 census. Three technical modifications were made to the definition in the 1970 census as described below:

The separate thresholds for families with a female householder with no husband present and all other families were eliminated. For the 1980 census, the weighted average of the poverty thresholds for these two types of families were applied to all types of families, regardless of the sex of the householder.

Farm families and farm unrelated

individuals no longer have a set of poverty thresholds that are lower than the thresholds applied to nonfarm families and unrelated individuals. Instead, the nonfarm thresholds were applied to all families and unrelated individuals regardless of residence.

3. The thresholds by size of family were extended from seven or more persons to nine or more persons.

These changes result in a minimal increase in the number of poor at the national level. For a complete discussion of these modifications and their impact, see Current Population Reports, Series P-60, No. 133.

The population covered in the poverty statistics derived from the 1980 census is essentially the same as in the 1970 census. The only difference is that in 1980, unrelated individuals under 15 years old were excluded from the poverty universe, while in 1970, only those under 14 years old were excluded. The poverty data from the 1980 census exclude all persons in group quarters and include all unrelated individuals regardless of age. It is unlikely that these differences in population coverage would have a significant impact when comparing the poverty data for persons from the 1980, 1970, and 1960 censuses.

Limitations

The term "Poverty" connotes a complex set of economic, social, and psychological conditions. The statistics presented in this report provide only estimates of economic poverty based on the receipt of money income before taxes. Readers should also be aware that for many different reasons there is a tendency for respondents to underreport their income. Overall, income earned from wages or salary is more accurately reported than other sources of income. (For a complete discussion of the limitations of the income data, see the section on "Income in 1979.")

It should be pointed out that nonmoney income is not considered in determining poverty status. In recent years, however, receipts from nonmoney transfers such as food stamps, housing subsidies, and health benefits have become an increasingly important element in the income of poor persons. For further information on the subject of valuing noncash benefits, see U.S. Bureau of the Census, Technical Paper 50, *Alternative Methods for Valuing Selected In-Kind Transfer Benefits and Measuring Their Effect on Poverty*. For a complete discussion of the limitations of the poverty concept, see Current Population Reports, Series P-60, No. 133.

Thresholds at the Poverty Level in 1979 by Size of Family and Number of Related Children Under 18 Years

(Figures in dollars. For meaning of symbols, see Introduction)

Type of Family Unit	Weighted average thresholds	Related children under 18 years							
		None	1	2	3	4	5	6	7 or more
Unrelated individual.....	3,686	3,686	...	...	...	...	...	...	...
Under 65 years.....	3,774	3,774	...	...	...	...	...	...	...
65 years and over.....	3,479	3,479	...	...	...	...	...	...	...
Families.....	4,723	4,723	...	...	...	...	...	...	...
Householder under 65 years.....	4,876	4,858	5,000	...	...	...	...	...	...
Householder 65 years and over.....	4,389	4,385	4,981	...	...	...	...	...	...
Families.....	5,787	5,674	5,839	5,864	...	...	...	...	...
Householder under 65 years.....	7,412	7,482	7,605	7,354	7,382	...	...	...	...
Householder 65 years and over.....	8,776	9,023	9,154	8,874	8,657	8,525	...	...	...
